

# NTN-5K Series Installation manual

***True Sine Wave Inverter***

• High Reliable Inverter •

NTN-5K is a 5KW highly reliable off-grid true sine wave DC-AC power inverter with built-in AC charger and UPS function(AC by-pass). Its key features include: digital design with MCU control, streamlined control circuitry that quickly responds to environmental changes and improves reliability, high quality fan with low acoustic noise, 10KW peak power, adjustable AC output voltage and frequency, -30~+70°C wide. Operating temperature range, complete protection features, and etc. Combined with batteries, the NTN-5K is suitable for use in residential, commercial, marine, automobile, mine, construction site, and remote areas with no access to utility power, and the output can be used to power fans, TV, radio, phone charger, PC/laptop, lighting, induction stove, air conditioner, electromechanical tool, communication equipment, power distribution cabinet, outdoor camping equipment, marine AC power, factory equipment, and etc.

# 1.Safety Guidelines

- Risk of electrical shock and energy hazard, all failures should be examined by the qualified technician. Please do not remove the case of the inverter by yourself.
- Please refrain from situating the inverter in damp environments or in close proximity to water sources.
- Please do not install the inverter in places with high ambient temperature or under direct sunlight.
- Please only connect batteries with the same brand and model number in one battery bank. Using batteries from different manufacturers or different capacity is strictly prohibited!
- Never allow a spark or flame in the vicinity of the batteries because they may ignite explosive gases during normal operation.
- Make sure the air flow from the fan is not obstructed at both sides (front and back) of the inverter. (Please allow at least 15cm of space).
- Please do not stack any object on the inverter.
- Please do not turn on the inverter before start the engine if the inverter is connected to vehicle's battery directly.
- Branch rated over current protection for the AC output circuit is to be provided at the time of installation.

# 2.Introduction

## 2.1 Model Encoding

| Type  | Communication Protocol | Note     |
|-------|------------------------|----------|
| Blank | Modbus protocol        | In Stock |
| CAN   | CAN Bus protocol       | In Stock |

## 2.2 Features

- Combining AC/DC charger, DC/AC Inverter, AC by-pass & support external MPPT solar charger
- AC utility charger up to 4520W
- UPS function (AC by-pass) without interruption, transfer time <10ms
- True sine wave output (THD <3%)
- High surge power up to 10KW
- Parallel synohronized operation up to 30KW (5+1 unit)
- Temperature controlled cooling fan
- AC output voltage and frequency selectable by DIP S.W
- Protections:
  - Input: Reverse polarity / DC low alarm / DC low shutdown / Over voltage
  - Output : Short circuit / Overload / Over temp.
- Battery over discharge protection (low voltage disconnect)
- -30°C~ +70°C wide operating temperature
- Suitable for lead-acid or li-ion batteries
- Support MODBus-RTU(RS-485) or CAN Bus protocol communication
- Graphical user interface controller CMU2E/CMUE-R for status monitoring and control
- Conformal coating
- 5 years warranty

## 3. Installation & Wiring

### 3.1 Precautions

- The unit should be mounted on a flat surface or holding rack with suitable strength.
- In order to ensure the lifespan of the unit, you should refrain from operating the unit in environments with high dust or moisture.
- NTN-5K is designed with built-in DC fans. Please make sure that the ventilation is not blocked. We recommend that there should be no barriers within 15cm of the ventilation slits, as shown below.

Figure 3-1 Arrangement suggestion

### 3.2 System Block Diagram

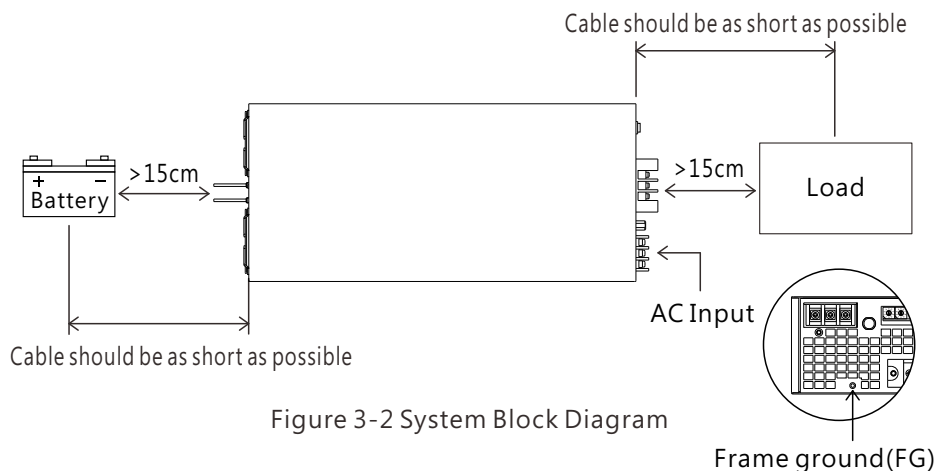

Figure 3-2 System Block Diagram

### 3.3 Installation Procedures

- ① Turn the inverter off by switching the Main S.W. to the OFF position.
- ② Select appropriate cables for connection between the battery and the inverter. Please refer to Section 3.4 for wiring guidance.
- ③ Connect the battery to the DC input terminals of the inverter. Attach the positive terminal (+) of the battery to the positive input terminal (+) and connect the negative terminal (-) of the battery to the negative input terminal (-). Please ensure not to reverse the polarity or create a short circuit.

- ④ Turn the Main S.W. switch to the ON position. The status indicator should start flashing in green and then display a steady green light, indicating normal operation.

### 3.4 Battery Wiring Selection

Wire connections should be as short as possible and less than 1.5 meter is highly recommended. Make sure that suitable wires are chosen based on safety requirement and rating of current. Small cross section will result in reduced efficiency or inability to achieve full power output and may also lead to overheating and fire hazards. Please refer to table 3-1.

| Rated current (A) | Cross section(mm <sup>2</sup> ) | AWG  |
|-------------------|---------------------------------|------|
| 40A               | 4                               | 10   |
| 63A               | 6                               | 8    |
| 80A               | 10                              | 6    |
| 100A              | 16                              | 4    |
| 125A              | 25                              | 2    |
| 160A              | 35                              | 1    |
| 190A              | 50                              | 0    |
| 230A              | 70                              | 000  |
| 260A              | 75                              | 0000 |

Table 3-1 Cable Recommendation

### 3.5 Battery Selection

| Model/Output | 124            | 224            | 148            | 248           | 2380 |
|--------------|----------------|----------------|----------------|---------------|------|
| NTN-5K       | 800Ah or above | 400Ah or above | 400Ah or above | 54Ah or above |      |

## 4. User Interface

### 4.1 AC Panel

#### Ⓐ AC bypass input terminals:

When AC mains power or utility is available, connecting the input to the AC mains will activate the AC bypass function. This allows the AC energy to feed the load directly from the AC mains and also charge the battery simultaneously.

M4 screws are used; Recommended cable size: 10 - 18 AWG; Recommended torque: 18kgf-cm.

#### Ⓑ Miniature circuit breaker (MCB):

In bypass mode, if the AC output is short-circuited or the load current exceeds the rated current of the MCB, the MCB will trip, disconnecting from the AC output and stopping the direct feed from the mains to prevent potential hazards. Once the abnormal condition is resolved, the user can press the reset button to resume bypass operation.

#### Ⓒ AD1,AD2:

Serve as the device address setting for communication purposes. Please refer to Section 4.6 for details.

#### Ⓓ CRL:

Termination resistor, used to stabilize the Modbus / CAN Bus communication and eliminate signals refraction.

#### Ⓔ COMM:

The Modbus-RTU / CAN Bus communication port.

#### Ⓕ AC output terminals:

M4 screws are used; Recommended cable size: 8 - 18 AWG; Recommended torque: 18kgf-cm.

#### Ⓖ PRL,PAR1,PAR2 and Remote ON-OFF

Serve as stable signals for multiple NTN-5K units connected in parallel.

#### Ⓗ Main Switch:

The inverter powers on if the switch is in the ON position; the inverter powers off if the switch is in the OFF position.

#### Ⓘ LED Indicators:

Indicate the status and the load condition of the inverter.

#### Ⓙ Remote Switch:

The same function as Main S.W. but can be used remotely. Please refer to Section 5.4 For details.

#### Ⓚ SW1:

Three-phase connection selection switch. Please refer to Section 5.3 for details.

#### Ⓛ SW2:

Voltage/Frequency selection switch. Please refer to Section 5.1 for details.

### 4.2 DC Panel

#### Ⓐ Ventilation slits:

To ensure proper operation and preserve the lifespan of the inverter, please ensure suitable ventilation is provided.

#### Ⓑ DC input terminals(+),(-):

M8 screws are used; Please refer to Section 3.4 for cable suggestion.

#### Ⓒ NTC:

Used for battery temperature compensation. Please refer to Section 5.6.4 for details.

### 4.3 LED Indicators

#### Status Indicator:

The LED is used to indicate the status of inverter, including inverter OK, remote on/off and power saving mode.

During the initial startup procedure, the Status Indicator will flash a green light to indicate that the inverter is undergoing system check. Once the process is completed, the Status Indicator will change to a steady green, indicating normal operation.

| Status | Green   | Orange  | Red  |
|--------|---|---|--|
|        | <ul style="list-style-type: none"> <li><span style="color: green;">●</span> Inverter OK</li> <li><span style="color: green;">■</span> System check</li> </ul> | <ul style="list-style-type: none"> <li><span style="color: orange;">●</span> Remote off</li> <li><span style="color: orange;">■</span> Saving mode</li> </ul> | <ul style="list-style-type: none"> <li><span style="color: red;">●</span> Abnormal Status (See below table)</li> </ul> |

Note: The inverter will initiate a system check procedure when it is powered on or switched to inverter mode by Remote off/on.

## DC Input Indicator:

It is used to show the input status of inverter.

Green light : When input voltage is greater than 25V(24V)/50V(48V)/335V(380V).

Orange light: When input voltage is within a range of 22V~25V(24V)/44V~50V(48V)/300V~335V(380V).

Red light : When input voltage is lower than 22V(24V)/44V(48V)/300V(380V) or over its specification. It flashes and a warning sound will be activated.

|          | Green        | Orange       | Red                  |
|----------|--------------|--------------|----------------------|
| DC Input | ● 25~31Vdc   | ● 22~25Vdc   | ● <22Vdc or >31Vdc   |
|          | ● 50~62Vdc   | ● 44~50Vdc   | ● <44Vdc or >62Vdc   |
|          | ● 335~420Vdc | ● 300~335Vdc | ● <300Vdc or >420Vdc |
|          | ☀️ Maintain  | ☀️ Charging  |                      |

## Load Condition Indicator :

1. Displaying the load status in use.

Green light : Indicates the light load status when the load is less than 40%.

Orange light: Indicates the medium load status when the load is between 40% and 80%.

Red light : Indicates the heavy load status when the load exceeds 80%.

Additionally, when the load exceeds 100%, a warning sound will also be activated.

| Load          | Green        | Orange         | Red          |
|---------------|--------------|----------------|--------------|
| Inverter Mode | ● <40% load  | ● 40~80% load  | ● >80% load  |
| Bypass Mode   | ☀️ <40% load | ☀️ 40~80% load | ☀️ >80% load |

2. Displaying the status of Bypass or Inverter in Energy-saving Mode.

|                               | Green        | Orange         | Red          |
|-------------------------------|--------------|----------------|--------------|
| Bypass (Energy-saving Mode)   | ☀️ <40% load | ☀️ 40~80% load | ☀️ >80% load |
| Inverter (Energy-saving Mode) | ● <40% load  | ● 40~80% load  | ● >80% load  |

## AC Input Indicator :

Used to display the status of the AC mains.

Green light : When the AC mains is connected and the voltage is present normally.

Flash in green light: When the AC mains is connected but the voltage exceeds  $\pm 10\%$  of the rated voltage, the green light will start flashing for warning.

Light off : When the AC mains is disconnected or not connected, LED will be off.

|          | Green                  |             |
|----------|------------------------|-------------|
| AC Input | ● Utility OK           | ● Steady    |
|          | ☀️ Utility error       | ☀️ Flashing |
|          | ○ Utility disconnected | ○ Light off |

Note: During the initial startup procedure, if there is input from the AC mains detected, the inverter will verify whether the AC voltage and frequency match the internal set values. The AC Input Indicator will flash a green light during this procedure.

## 4.4 Pin Assignment of CRL

### Connector Pin No. Assignment:

| Pin No. | Function | Description  |
|---------|----------|--|
| 1,3     | RL       | Short: Termination resistors(120Ω) For MODBus/CANBus communication, please use Jumper (pin1,3) |
| 2,4     | NC       | No need to communicate, please use Jumper (pin2,4)   |

Note: AD1,AD2 switch for MODBus/CANBus interface address setting, please refer to the user manual for more details

## 4.5 Pin Assignment of COMM

Connector Pin No. Assignment: EC381V-04P or equivalent

| Pin No. | Function | Description  |
|---------|----------|--|
| 1       | GND-AUX  | Auxiliary voltage output GND.                                    |
| 2       | D+/CANH  | For Modbus model: Data line used in Modbus interface.            |
|         |          | For CAN Bus model: Data line used in CAN Bus interface.          |
| 3       | D-/CANL  | For Modbus model: Data line used in Modbus interface.            |
|         |          | For CAN Bus model: Data line used in CAN Bus interface.          |
| 4       | +5V_AUX  | Auxiliary voltage output, 4.5~5.5V, referenced to GND-AUX (pin1) |

Note: The same function as Main S.W. but can be used remotely.  
Please refer to Section 5.4 For details.

## 4.6 Pin Assignment of PAR1,PAR2

Connector Pin No. Assignment: HRS DF11-08DP-2DS or equivalent

| Pin No. | Function      | Description  |
|---------|---------------|--|
| 1       | +5V_AUX2      | Auxiliary voltage output, 4.5~5.5V, referenced to GND-AUX (pin2). (Only for REMOTE ON-OFF)                                     |
| 2       | GND_AUX2      | Auxiliary voltage output GND_AUX2 (pin2).  |
| 3       | REMOTE ON-OFF | The unit can turn the output ON/OFF by dry contact between Remote ON/OFF and +5V_AUX2.(Note) Short: Power ON ; Open: Power OFF |
| 4       | SOLAR_ON_OFF  | External MPPT charger control, referenced to GND_AUX2 (pin2).  |
| 5       | DA            | Data line used for parallel control.   |
| 6       | SYNC_BUS      | Phase synchronization used for parallel control.   |
| 7       | DB            | Data line used for parallel control.   |
| 8       | SYNC_BUS2     | Mode synchronization used for parallel control.  |

Note: Isolated signal, referenced to GND\_AUX2

## 4.7 Pin Assignment of Remote Switch

Connector Pin No. Assignment: HRS DF11-04DP-2DS or equivalent

| Pin No. | Function      | Description  |
|---------|---------------|--|
| 1,2,3,4 | REMOTE SWITCH | The unit can be remotely turned the output ON/OFF by dry contact between Pin1,2 & 3,4.<br>Power ON : Short Pin1 to 2 and Pin3 to 4 ; Power OFF : Pin1 ~ Pin4 open. |

## 4.8 Communication Address/ID Assignment

Each NTN-5K unit should have their unique and own device address to communicate over the bus. AD1 and AD2 allow users to designate an address/ID for the Modbus/CAN bus (with maximum of 64 addresses). Please refer to the table below for detailed settings.

| Address/ID | Switch position |     |
|------------|-----------------|-----|
|            | AD1             | AD2 |
| 0          | 0               | 0   |
| 1          | 0               | 1   |
| 2          | 0               | 2   |
| 3          | 0               | 3   |
| 4          | 0               | 4   |
| 5          | 0               | 5   |
| 6          | 0               | 6   |
| 7          | 0               | 7   |
| 8          | 0               | 8   |
| 9          | 0               | 9   |
| 10         | 1               | 0   |
| 11         | 1               | 1   |
| 12         | 1               | 2   |
| 13         | 1               | 3   |
| 14         | 1               | 4   |
| 15         | 1               | 5   |
| 16         | 1               | 6   |
| 17         | 1               | 7   |
| 18         | 1               | 8   |
| 19         | 1               | 9   |
| 20         | 2               | 0   |
| 21         | 2               | 1   |
| 22         | 2               | 2   |
| 23         | 2               | 3   |
| 24         | 2               | 4   |
| 25         | 2               | 5   |
| 26         | 2               | 6   |
| 27         | 2               | 7   |
| 28         | 2               | 8   |
| 29         | 2               | 9   |
| 30         | 3               | 0   |
| 31         | 3               | 1   |

| Address/ID | Switch position |     |
|------------|-----------------|-----|
|            | AD1             | AD2 |
| 32         | 3               | 2   |
| 33         | 3               | 3   |
| 34         | 3               | 4   |
| 35         | 3               | 5   |
| 36         | 3               | 6   |
| 37         | 3               | 7   |
| 38         | 3               | 8   |
| 39         | 3               | 9   |
| 40         | 4               | 0   |
| 41         | 4               | 1   |
| 42         | 4               | 2   |
| 43         | 4               | 3   |
| 44         | 4               | 4   |
| 45         | 4               | 5   |
| 46         | 4               | 6   |
| 47         | 4               | 7   |
| 48         | 4               | 8   |
| 49         | 4               | 9   |
| 50         | 5               | 0   |
| 51         | 5               | 1   |
| 52         | 5               | 2   |
| 53         | 5               | 3   |
| 54         | 5               | 4   |
| 55         | 5               | 5   |
| 56         | 5               | 6   |
| 57         | 5               | 7   |
| 58         | 5               | 8   |
| 59         | 5               | 9   |
| 60         | 6               | 0   |
| 61         | 6               | 1   |
| 62         | 6               | 2   |
| 63         | 6               | 3   |

## 5. Explanation of Operation

### 5.1 Procedure of Setting Output voltage, Frequency and Saving Mode

#### 5.1.1 Output Voltage and Frequency Setting

Factory settings are either 110Vac/60Hz or 230Vac/50Hz. Users can adjust the voltage and frequency through the DIP switches of SW2 on the AC panel. S1/S2 are used for voltage adjustment, and SW3 is for frequency adjustment. Please refer to the table below.

| AC Output Voltage, Frequency, Saving Mode selectable by the SW2 |                        |           |                      |
|---|------------------------|-----------|----------------------|
| S1  | S2                     | S3        | S4                   |
| OFF   | OFF : 100Vac or 200Vac | ON : 50Hz | ON : Saving Mode     |
| OFF   | ON : 110Vac or 220Vac  |           |                      |
| ON  | OFF : 115Vac or 230Vac | OFF: 60Hz | OFF: Non-Saving Mode |
| ON  | ON : 120Vac or 240Vac  |           |                      |

#### 5.1.2 Saving Mode Setting

To prevent unnecessary battery energy discharge when the inverter is not connected to a load, the Saving Mode function can be activated to reduce further power consumption from the inverter, which is to set S4 of SW2 to the on position. In Saving Mode, if the inverter detects no load (< 10W) for 3 seconds, it will shut off its output. It will then periodically check the output load status to switch back. If a load greater than 25W is detected or connected, the inverter will return to normal operation and provide AC energy.

### 5.2 Parallel Synchronized Operation (Single-phase Parallel)

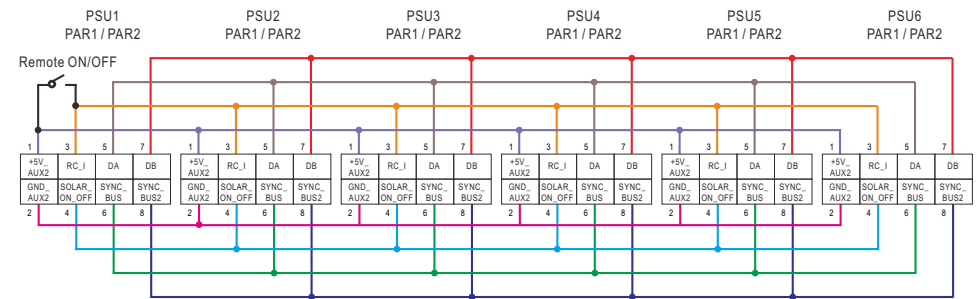

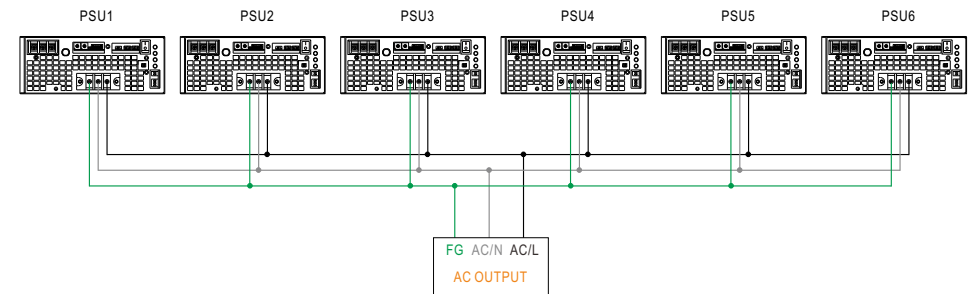

NTN-5K has the built-in active current sharing function and can be connected in parallel, up to 6 units, to provide higher output power as exhibited below:

- ✘The output voltage and frequency settings must be the same for all units.
- ✘The inverter should be paralleled using short and large diameter wiring and then connected to the load.
- ✘The total output current must not exceed the value determined by the following equation:

$$\text{Maximum output current at parallel operation} = (\text{Rated current per unit}) \times (\text{Number of unit}) \times 95\% ; \text{ when parallel unit less than 6.}$$

#### ✘ PAR1/PAR2, PRL Function pin connection

| Parallel | PSU1 |     | PSU2 |     | PSU3 |     | PSU4 |     | PSU5 |     | PSU6 |     |
|----------|------|-----|------|-----|------|-----|------|-----|------|-----|------|-----|
|          | PAR1 | PRL | PAR1 | PRL | PAR1 | PRL | PAR1 | PRL | PAR1 | PRL | PAR1 | PRL |
| 1 unit   | X    | ON  | —    | —   | —    | —   | —    | —   | —    | —   | —    | —   |
| 2 unit   | V    | ON  | V    | ON  | —    | —   | —    | —   | —    | —   | —    | —   |
| 3 unit   | V    | ON  | V    | OFF | V    | ON  | —    | —   | —    | —   | —    | —   |
| 4 unit   | V    | ON  | V    | OFF | V    | OFF | V    | ON  | —    | —   | —    | —   |
| 5 unit   | V    | ON  | V    | OFF | V    | OFF | V    | OFF | V    | ON  | —    | —   |
| 6 unit   | V    | ON  | V    | OFF | V    | OFF | V    | OFF | V    | OFF | V    | ON  |

If the lines of PAR1 / PAR2 are too long, they should be twisted in pairs to avoid the noise.

## 5.3 Three-phase 4-wire Output

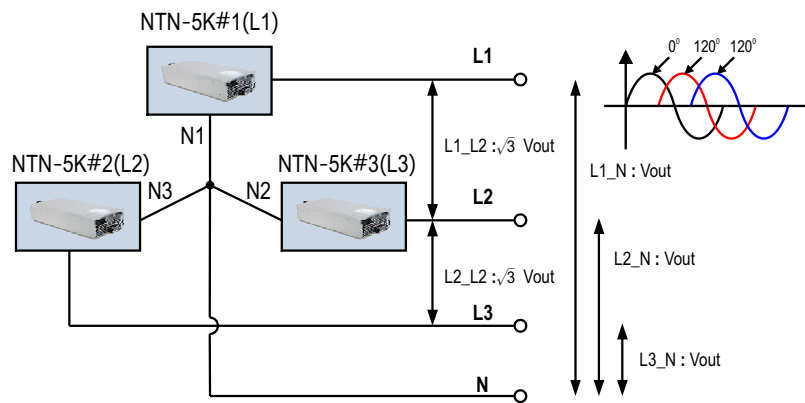

### 5.3.1 Three-phase 4-wire Output Setting

Users can connect three units of NTN-5K to form a three-phase 4-wire output, providing three AC voltage sources with equal voltage, the same frequency, but a phase difference of  $120^\circ$ .

NOTE:

1. The output voltage and frequency settings must be the same for the three units.
2. It is recommended to power on the unit with the L1,  $0^\circ$  setting first.
3. Attention should also be paid to the connection method of the input terminals. Please refer to the illustration of Arrangement for the AC input below.
4. If power rating needs to be increased, NTN-5K units should be configured according to section 5.3.3.

### Arrangement for the AC Output

| S1  | S2  | AC output phase  |
|-----|-----|------------------|
| OFF | OFF | L1, $0^\circ$    |
| OFF | ON  | L2, $+120^\circ$ |
| ON  | OFF | L3, $-120^\circ$ |

### Arrangement for the AC input

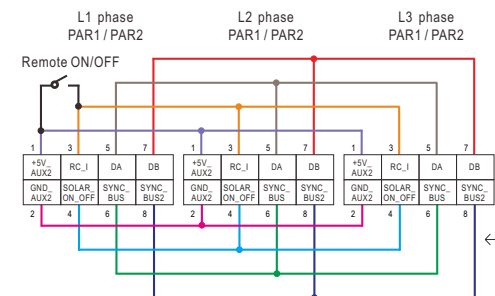

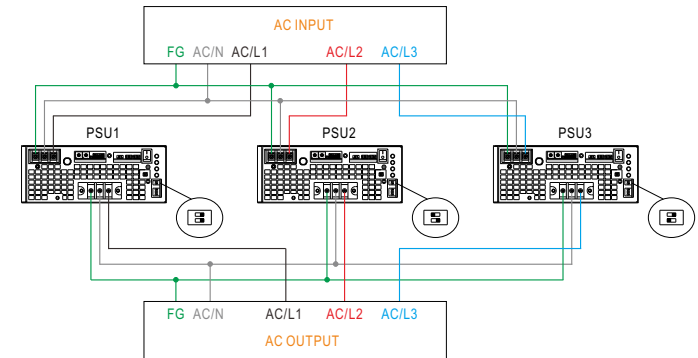

### 5.3.2 Configuration for Three-phase 4-wire Output

#### ◎ PAR1/PRL S.W

| Quantity | L1 phase |     | L2 phase |     | L3 phase |     |
|----------|----------|-----|----------|-----|----------|-----|
|          | PSU1     |     | PSU2     |     | PSU3     |     |
|          | PAR1     | PRL | PAR1     | PRL | PAR1     | PRL |
| 3 units  | V        | ON  | V        | OFF | V        | ON  |

| L1 phase/SW1 |     | L2 phase/SW1 |    | L3 phase/SW1 |     |
|--------------|-----|--------------|----|--------------|-----|
| S1           | S2  | S1           | S2 | S1           | S2  |
| OFF          | OFF | OFF          | ON | ON           | OFF |

← If the lines of PAR1 / PAR2 are too long, they should be twisted in pairs to avoid the noise.

### 5.3.3 Expansion Power Output Setting for Three-phase 4-wire Configuration

In addition to connecting three units of NTN-5K for a three-phase 4-wire output, users can also increase the output power of the three-phase 4-wire configuration. The maximum expansion per phase can be increased to 30KVA.

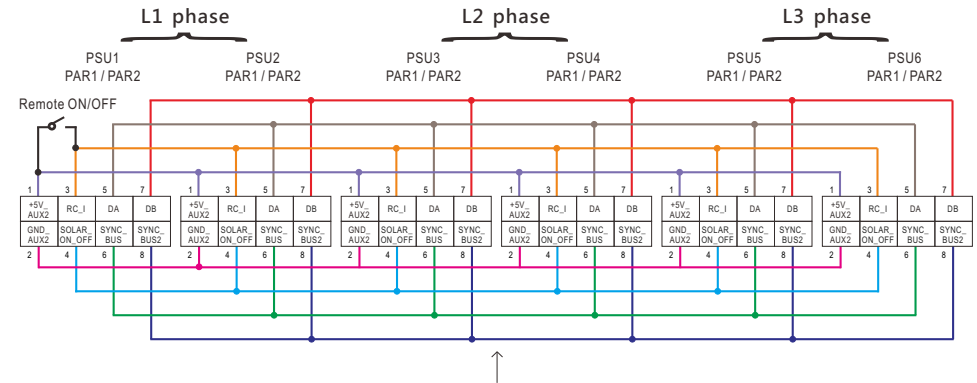

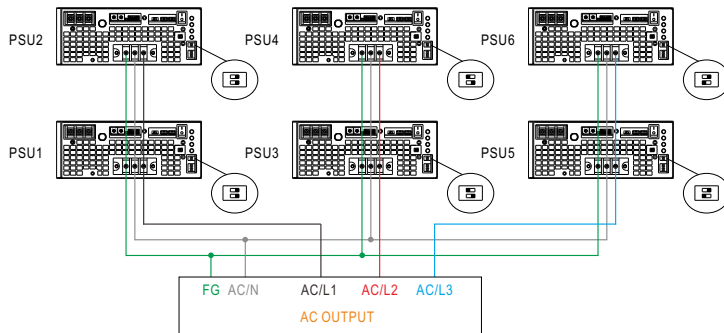

- ※ The output voltage and frequency settings must be the same for all units.
- ※ The inverter should be paralleled using short and large diameter wiring and then connected to the load.
- ※ The total output current must not exceed the value determined by the following equation:

$$\text{Maximum output current per phase} = (\text{Rated current per unit}) \times (\text{Number of unit}) \times 95\% ; \text{ when parallel unit less than 6.}$$

◎ Instructions for connecting TWO units of NTN-5K per phase, connections and settings for PAR1/PRL are as follows:

| Quantity | L1 phase |     | L2 phase |     |      |     | L3 phase |     |      |     |      |     |
|----------|----------|-----|----------|-----|------|-----|----------|-----|------|-----|------|-----|
|          | PSU1     |     | PSU2     |     | PSU3 |     | PSU4     |     | PSU5 |     | PSU6 |     |
|          | PAR1     | PRL | PAR1     | PRL | PAR1 | PRL | PAR1     | PRL | PAR1 | PRL | PAR1 | PRL |
| 6 units  | V        | ON  | V        | OFF | V    | OFF | V        | OFF | V    | OFF | V    | ON  |

| L1 phase/SW1 |     | L2 phase/SW1 |    | L3 phase/SW1 |     |
|--------------|-----|--------------|----|--------------|-----|
| S1           | S2  | S1           | S2 | S1           | S2  |
| OFF          | OFF | OFF          | ON | ON           | OFF |

If the lines of PAR1 / PAR2 are too long, they should be twisted in pairs to avoid the noise.

◎ Instructions for connecting THREE units of NTN-5K per phase, connections and settings for PAR1/PRL are as follows:

| Quantity | L1 phase |     | L2 phase |     |      |     | L3 phase |     |      |     |      |     |
|----------|----------|-----|----------|-----|------|-----|----------|-----|------|-----|------|-----|
|          | PSU1     |     | PSU3     |     | PSU4 |     | PSU6     |     | PSU7 |     | PSU9 |     |
|          | PAR1     | PRL | PAR1     | PRL | PAR1 | PRL | PAR1     | PRL | PAR1 | PRL | PAR1 | PRL |
| 9 units  | V        | ON  | V        | OFF | V    | OFF | V        | OFF | V    | OFF | V    | ON  |

NOTE: Please refer to the instructions for connecting TWO units for the connection method of PAR1/PAR2 and the settings for SW1. Please also ensure that all signals of PAR1/PAR2 are connected to each others in a three-phase 4-wire configuration.

◎ Instructions for connecting FOUR units of NTN-5K per phase, connections and settings for PAR1/PRL are as follows:

| Quantity | L1 phase |     | L2 phase |     |      |     | L3 phase |     |      |     |       |     |
|----------|----------|-----|----------|-----|------|-----|----------|-----|------|-----|-------|-----|
|          | PSU1     |     | PSU4     |     | PSU5 |     | PSU8     |     | PSU9 |     | PSU12 |     |
|          | PAR1     | PRL | PAR1     | PRL | PAR1 | PRL | PAR1     | PRL | PAR1 | PRL | PAR1  | PRL |
| 12 units | V        | ON  | V        | OFF | V    | OFF | V        | OFF | V    | OFF | V     | ON  |

NOTE: Please refer to the instructions for connecting TWO units for the connection method of PAR1/PAR2 and the settings for SW1. Please also ensure that all signals of PAR1/PAR2 are connected to each others in a three-phase 4-wire configuration.

◎ Instructions for connecting FIVE units of NTN-5K per phase, connections and settings for PAR1/PRL are as follows:

| Quantity | L1 phase |     | L2 phase |     |      |     | L3 phase |     |       |     |       |     |
|----------|----------|-----|----------|-----|------|-----|----------|-----|-------|-----|-------|-----|
|          | PSU1     |     | PSU5     |     | PSU6 |     | PSU10    |     | PSU11 |     | PSU15 |     |
|          | PAR1     | PRL | PAR1     | PRL | PAR1 | PRL | PAR1     | PRL | PAR1  | PRL | PAR1  | PRL |
| 15 units | V        | ON  | V        | OFF | V    | OFF | V        | OFF | V     | OFF | V     | ON  |

NOTE: Please refer to the instructions for connecting TWO units for the connection method of PAR1/PAR2 and the settings for SW1. Please also ensure that all signals of PAR1/PAR2 are connected to each others in a three-phase 4-wire configuration.

© Instructions for connecting SIX units of NTN-5K per phase, connections and settings for PAR1/PRL are as follows:

| Quantity | L1 phase |     |     |      |     |      | L2 phase |     |       |     |       |     | L3 phase |       |     |  |  |  |
|----------|----------|-----|-----|------|-----|------|----------|-----|-------|-----|-------|-----|----------|-------|-----|--|--|--|
|          | PSU1     |     | ... | PSU6 |     | PSU7 |          | ... | PSU12 |     | PSU13 |     | ...      | PSU18 |     |  |  |  |
|          | PAR1     | PRL |     | PAR1 | PRL | PAR1 | PRL      |     | PAR1  | PRL | PAR1  | PRL |          | PAR1  | PRL |  |  |  |
| 18 units | V        | ON  |     | V    | OFF | V    | OFF      |     | V     | OFF | V     | OFF |          | V     | ON  |  |  |  |

NOTE: Please refer to the instructions for connecting TWO units for the connection method of PAR1/PAR2 and the settings for SW1. Please also ensure that all signals of PAR1/PAR2 are connected to each others in a three-phase 4-wire configuration.

| S1  | S2  | AC output phase |
|-----|-----|-----------------|
| OFF | OFF | L1, 0°          |
| ON  | ON  | L2, +180°       |

## 5.4 Single-phase 3-wire Output (124/148 only)

### 5.4.1 Single-phase 3-wire Output Setting

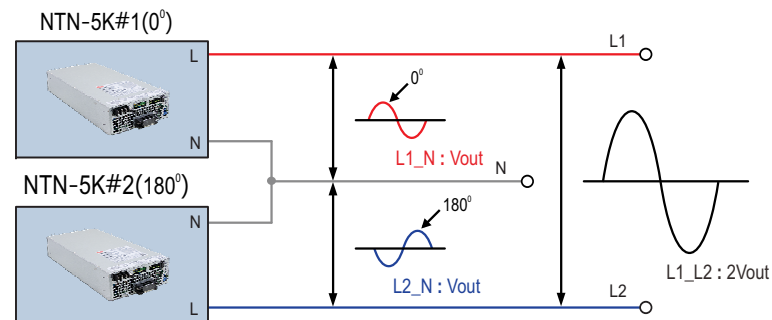

Users can connect two units of NTN-5K-1xx to form a single-phase 3-wire output, which doubles the AC voltage output of a single inverter unit while maintaining the same frequency.

For instance: Two inverter units that generate 110Vac/60Hz each can provide up to 220Vac/60Hz between the live terminals of L1 and L2.

NOTE:

1. The output voltage and frequency settings must be the same for both units.
2. It is recommended to power on the units simultaneously.
3. Pay close attention to the connection method of the AC input if the AC bypass function is needed. Please refer to section 5.4.2.
4. If the power rating needs to be increased, NTN-5K units should be configured according to section 5.4.4.

Arrangement for the AC Output

### 5.4.2 Input Connection for Single-phase 3-wire

The AC input for inverters in a single-phase 3-wire setting requires the phases to differ by 180 degrees in order to be connected. Therefore, this configuration cannot be directly connected to the mains electricity. The AC input must be connected through appropriate equipment, such as a center-tapped transformer.

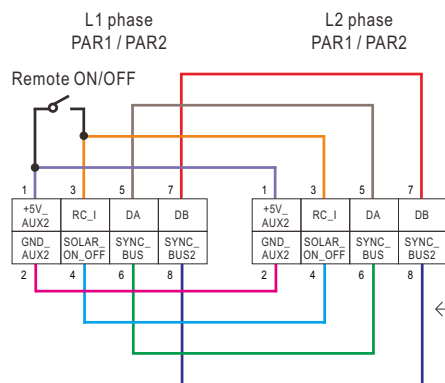

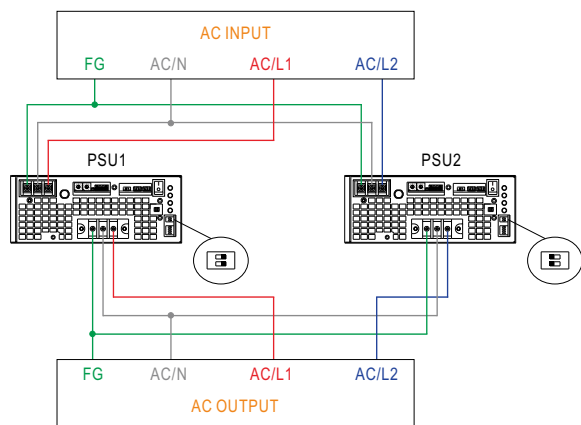

### 5.4.3 Configuration for Single-phase 3-wire

#### ◎ PAR1/PRL S.W

|          |      |     |      |     |
|----------|------|-----|------|-----|
| Quantity | 0°   |     | 180° |     |
|          | PSU1 |     | PSU2 |     |
|          | PAR1 | PRL | PAR1 | PRL |
| 2 units  | V    | ON  | V    | ON  |

|        |     |          |    |
|--------|-----|----------|----|
| 0°/SW1 |     | 180°/SW1 |    |
| S1     | S2  | S1       | S2 |
| OFF    | OFF | ON       | ON |

← If the lines of PAR1 / PAR2 are too long, they should be twisted in pairs to avoid the noise.

### 5.4.4 Expansion Power Output Setting for Single-phase 3-wire Configuration

In addition to connecting two units of NTN-5K for a single-phase 3-wire output, users can also increase the output power rating of this configuration. The maximum power can be increased up to 24KVA.

※ The output voltage and frequency settings must be the same for all units.

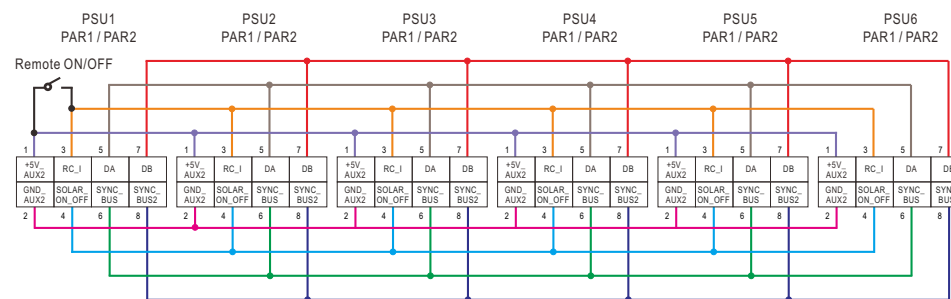

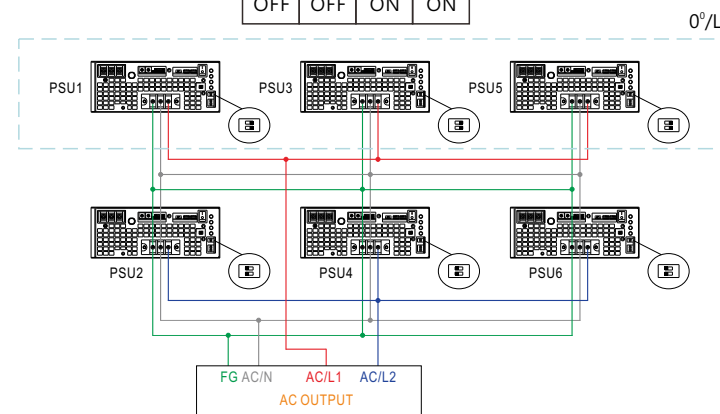

※ The inverters should be paralleled using short, large-diameter wiring before being connected to the loads.

※ The total output current must not exceed the value determined by the following equation: Maximum output power = (Rated power per unit) x (Number of unit) x 95%.

◎ Instructions for connecting 6 units of NTN-5K per degree, connections and settings for PAR1/PRL are as follows:

|          |      |     |      |     |      |     |      |     |      |     |      |     |
|----------|------|-----|------|-----|------|-----|------|-----|------|-----|------|-----|
| Quantity | PSU1 |     | PSU2 |     | PSU3 |     | PSU4 |     | PSU5 |     | PSU6 |     |
|          | PAR1 | PRL | PAR1 | PRL | PAR1 | PRL | PAR1 | PRL | PAR1 | PRL | PAR1 | PRL |
| 6 units  | V    | ON  | V    | OFF | V    | OFF | V    | OFF | V    | OFF | V    | ON  |

|        |     |          |    |
|--------|-----|----------|----|
| 0°/SW1 |     | 180°/SW1 |    |
| S1     | S2  | S1       | S2 |
| OFF    | OFF | ON       | ON |

↑ If the lines of PAR1 / PAR2 are too long, they should be twisted in pairs to avoid the noise.

## 5.5 Remote ON-OFF Control

The remote ON-OFF control for the inverter can be divided into Remote Switch and Remote ON-OFF. The detailed description is as follows.

### 5.5.1 Remote Switch

The function of Remote Switch is identical to that of the Main S.W., the logic operation between the Remote Switch and the Main S.W. is shown in the table below. When both the Remote Switch and Main S.W. are set to OFF, the inverter enters a completely shut-down state, with no internal circuitry operation. Even if the AC input of the inverter is connected to the AC mains, it will not perform bypass functionality nor charge the battery.

Table for the logic operation between the Remote Switch and the Main S.W.:

| Remote Switch | Main S.W. | Inverter state |
|---------------|-----------|----------------|
| OFF           | OFF       | Shut-down      |
| ON            | OFF       | Operation      |
| OFF           | ON        | Operation      |
| ON            | ON        | Operation      |

Operation description of Remote Switch:

| Remote Switch                                  | Inverter state |
|--|----------------|
| Pin 1 to pin 2 shorted; Pin 3 to pin 4 shorted | Operation      |
| Pin 1 to pin 2 opened; Pin 3 to pin 4 opened   | Shut-down      |

**NOTE: Risk of inverter damage:** Each inverter should have its independent switch used for the Remote Switch function. Sharing the same switch for Remote Switch among multiple inverters is prohibited.

### 5.5.2 Remote ON-OFF

The Remote ON-OFF function sets the inverter into standby mode. During this state, internal circuitry such as the MCU operates normally, while only the AC output is deactivated. If AC mains power is supplied to the inverter at this time, it will simultaneously charge the battery.

(Power consumption for the standby mode is approximately 20W)

| PAR1/PAR2     | Remote ON-OFF | AC Output Status   |
|---------------|---------------|--------------------|
| PIN1 and PIN3 | Short         | Power inverter ON  |
| PIN1 and PIN3 | Open          | Power inverter OFF |

**NOTE:** Remote ON-OFF can only be activated when either the Main S.W. or the Remote Switch is set to ON.

## 5.6 Explanation of Operating Logic

The NTN-5K is a digital intelligent DC/AC sine wave inverter with two operating modes: UPS (Uninterruptible Power Supply) and Energy-saving Mode. It is set to UPS Mode by default, but users have the flexibility to switch to Energy-saving Mode based on difference applications through the communication protocol.

The main difference between UPS Mode and Energy-saving Mode is the level of energy saving. In UPS Mode, when the utility power is available, the NTN-5K operates in bypass mode, supplying power directly from the utility to the load, resulting in lower energy savings (please refer to Figure 5.1 Diagram of UPS mode control logic for details).

Both UPS Mode and Energy-saving Mode can be reconfigured via INV\_CONFIG (0x0101) command. For detailed instructions, please refer to Chapter 6.

### 5.6.1 Explanation of UPS Mode

Figure 5.1 Diagram of UPS Mode control logic

Table 5-1 Indicator table of UPS Mode

|             | t1-t2 | t2-t3 | t3-t4 | t4-t5 | t5-t6 | t6-t7 | t7-t8 | t8-t9 | t9~ |
|-------------|-------|-------|-------|-------|-------|-------|-------|-------|-----|
| Status      | ●     | ●     | ●     | ●     | ●     | ●     | ●     | ●     | ●   |
| DC input    | ☀     | ☀     | ☀     | ●     | ●→●   | ☀     | ☀     | ☀→●→● | ☀   |
| Load signal | ☀     | ☀     | ☀     | ●     | ●     | ☀     | ☀     | ●     | ○   |
| AC input    | ●     | ●     | ●     | ○     | ○     | ●     | ●     | ○     | ○   |

NOTE:1. The color of the Load Condition Indicator varies in loads.

Information in the table is for reference only.

2. The AC Input Indicator flashes in green in case of utility power abnormalities. The table only illustrates utility power disconnection as an example.

t1 : When the user turns on the NTN-5K and the AC input detects utility power, the inverter automatically enters bypass mode, allowing the utility power to directly feed to the loads and charging the battery simultaneously. In addition, when the battery voltage is below 26.5V, the inverter sets the SOLAR\_ON\_OFF signal (PIN4 of PAR1/PAR2) to a high level. If the system is configured with a solar charger, this signal can be used as an enable signal for the external charger.

t2 : When the battery voltage exceeds 28.5V, the NTN-5K sets the SOLAR\_ON\_OFF signal to a low level, which can be used as a disable signal for the external charger.

t3 : When the battery voltage reaches 28.8V, it is in a fully charged state. The charger enters float charge mode and the DC Input Indicator flashes in green.

t4 : When the NTN-5K detects a power outage or abnormal voltage/frequency from the utility, it enters inverter mode, disabling the charging function and converting battery energy into AC energy for the loads.

t5 : When the NTN-5K is in inverter mode, it converts the battery's DC energy into AC energy to supply the loads. As the battery voltage continues to decrease in this mode, when battery voltage drops below 26.5V, the inverter sets the SOLAR\_ON\_OFF signal to a high level, indicating to the external solar charger that it can charge the battery.

t6 : When the NTN-5K detects the reconnection of utility power or the return to normal voltage/frequency, it re-enters bypass mode, allowing utility power to feed the loads and charging the battery simultaneously. Similarly, if the battery voltage is below 26.5V, the NTN-5K sets the SOLAR\_ON\_OFF signal to a high level, enabling the external charger to charge the battery.

t7 : Same as t2

t8 : Same as t3

t9 : When the battery voltage drops below 22V, the DC Input Indicator lights in red and starts a warning sound, indicating low battery voltage alarm. If the battery continues to discharge and its voltage falls below 19V, indicating that the battery capacity is nearly drained, the NTN-5K will turn off itself for low DC voltage shutdown protection.

### 5.6.2 Explanation of Energy Saving Mode Control Logic

Figure 5.2 Diagram of Energy-saving Mode control logic

Table 5-2 Indicator table of Energy-saving Mode

|             | t1-t2 | t2-t3 | t3-t4 | t4-t5 | t5-t6 | t6-t7 | t7~ |
|-------------|-------|-------|-------|-------|-------|-------|-----|
| Status      | ●     | ●     | ●     | ●     | ●     | ●     | ●   |
| DC input    | ☀     | ☀     | ●     | ●→●   | ☀     | ●→●→● | ☀   |
| Load signal | ☀     | ☀     | ●     | ●     | ☀     | ●     | ○   |
| AC input    | ●     | ●     | ●     | ●     | ●     | ○     | ○   |

NOTE:1. The color of the Load Condition Indicator varies in loads.

Information in the table is for reference only.

2. The AC Input Indicator flashes in green in case of utility power abnormalities. The table only illustrates utility power disconnection as an example.

- t1 : When the user turns on the NTN-5K and the AC input detects utility power, the NTN-5K automatically enters bypass mode. Unlike UPS mode, the Load Condition Indicator flashes in bypass mode, making it easier for users to identify the difference. Utility power directly is fed to the loads while simultaneously charging the battery. Additionally, when the battery voltage is below 26.5V, the inverter also sets the SOLAR\_ON\_OFF signal (PIN4 of PAR1/PAR2) to a high level. If the system is configured with a solar charger, this signal can be used as an enable signal for the external charger.
- t2 : When the battery voltage exceeds 28.5V, the NTN-5K sets the SOLAR\_ON\_OFF signal to a low level, which can be used as a disable signal for the external charger.
- t3 : When the battery voltage reaches 28.8V, indicating that the battery is fully charged, the NTN-5K switches to inverter mode, disabling the charging function and supplying AC energy to the loads from the battery.
- t4 : When the NTN-5K is in inverter mode, it converts the battery's DC energy into AC energy to supply the loads. As the battery voltage continues to decrease in this mode, when battery voltage drops below 26.5V, the inverter sets the SOLAR\_ON\_OFF signal to a high level, indicating to the external solar charger that it can charge the battery.
- t5 : When the battery voltage discharges below 22V (warning voltage), the inverter switches back to bypass mode if the utility power is connected normally. In bypass mode, utility power is fed to the loads while charging the battery simultaneously.
- t6 : When the NTN-5K detects a power outage or abnormal voltage/frequency from the utility, it enters inverter mode, disabling the charging function and converting battery energy into AC energy for the loads.
- t7 : When the battery voltage drops below 22V, the DC Input Indicator lights in red and starts a warning sound, indicating low battery voltage alarm. If the battery continues to discharge and its voltage falls below 19V, indicating that the battery capacity is nearly drained, the NTN-5K will turn off itself for low DC voltage shutdown protection.

### 5.6.3 Configuration Recommendation for an External Charger

Under UPS Mode or Energy-saving Mode, adding an MPPT solar charger at the battery end can extend the battery's usage time. Additionally, MEANWELL recommends that the charging on/off control of the external charger be controlled by the NTN-5K's SOLAR\_CTRL signal (PIN4 of PAR1/PAR2), which can further optimize the battery charging process.

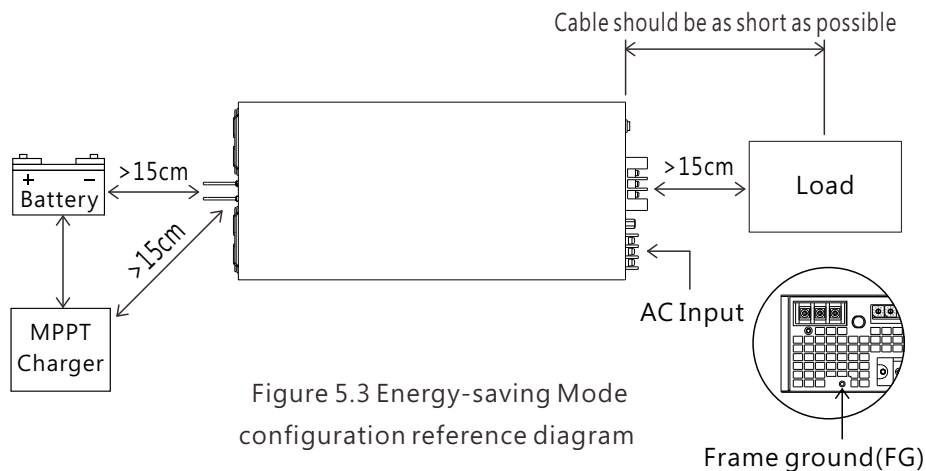

Figure 5.3 Energy-saving Mode configuration reference diagram

| PAR1/PAR2    | SOLAR_ON_OFF | Suggested operation of external charger |
|--------------|--------------|---|
| PIN4 to PIN2 | 5V           | Continue charging                       |
| PIN4 to PIN2 | 0V           | Stop charging                           |

## 5.7 AC Charger

NTN-5K adopts both 2 and 3 stage charging curves for selection. 2 stage is for easy and fast charging. 3 stage goes into float mode after the battery is fully charged. Users can choose between 2 or 3 stage according to the demand. Charger settings can be selected and adjusted via communication protocol. For detailed information, please refer to commands related to charging such as CURVE\_CONFIG(0x00B4) in Chapter 6: Communication Protocol.

NOTE: In AC bypass mode, the NTN-5K adjusts the proportion of the charging current based on the AC output power to prevent reduced lifespan of components (like the input relay), caused by excessive AC input power. For example, the maximum charging input current is limited to 80% of the power rating when the AC output carries 20% of the power rating.

### 5.7.1 2 Stage Charging

In the initial stage of charging, the charger charges the battery with the maximum current. After a period of time (depending on the battery capacity), the charging current decreases gradually. When the charging current drops to 10% of the rated current, the DC Input Indicator lights up in green, indicating that the charging process is complete.

#### 2 stage charging curve

#### Explanation of 2 stage charging curve

- ① Stage 1 (Constant current): Maximum constant current is applied for fast charging, until the voltage of battery reaches to boost voltage
  - ② Stage 2 (Constant voltage): In this stage, charger applies a constant voltage on the battery. Charging current decreases gradually and then shuts down when charging current drops to 10% of rated current.
- \* Suitable for lead-acid batteries, such as flooded water type, Gel colloid type, AGM adsorption glass fiber and lithium batteries, such as lithium iron, lithium manganese, ternary lithium.

### 5.7.2 3 Stage Charging

In the initial stage of charging, the charger charges the battery with the maximum current. After a period of time (depending on the battery capacity), the charging current gradually decreases. When the charging current drops to 10% of the rated current. The DC Input Indiation flashes in green, indicating that the charging is complete and the charger remains float charging stage.

3 stage charging curve

#### Explanation of 3 stage charging curve

- ① Stage 1 (Constant current): Maximum constant current is applied for fast charging, until the voltage of battery reaches to boost voltage.
- ② Stage 2 (Constant voltage): In this stage, charger applies a constant voltage on the battery. Charging current decreases gradually and then goes into the final stage when charging current drops to 10% of rated current.
- ③ Stage 3 (float charging): The charger is able to provide a float voltage after 2 stage charging in order to keep the battery fully charged at all times, especially suitable for lead-acid batteries.

\* Suitable for lead-acid batteries (flooded water type, Gel colloid type, AGM adsorption glass fiber).

### 5.7.3 Setting of Charging Curve

The factory default parameters are set to 'Default, programmable', and they are detailed in the tables below. If you wish to modify the charging parameters, you can do so through the communication protocol. For detailed information, please refer to commands related to charging, such as CURVE\_CONFIG (0x00B4), in Chapter 6: Communication Protocol.

| 24V model                    |                      |                    |                                      |
|------------------------------|----------------------|--------------------|--------------------------------------|
| Description                  | CC(default)          | V <sub>boost</sub> | V <sub>float</sub><br>(3 stage only) |
| Default, programmable        | 120A/1XX<br>135A/2XX | 28.8V              | 27.6V                                |
| Pre-defined, gel battery     |                      | 28.0V              | 27.2V                                |

### 5.7.4 Battery Temperature Compensation

- The battery temperature sensor (a NTC) that comes with the product can be connected to the battery for sensing temperature of the battery. The charge is able to work normally without the sensor.
- The temperature sensor which comes with the product can be connected to pin1 NTC(RTH-) and pin2 NTC(RTH+) in NTC connector. The wire length of the sensor can be adjusted according to different applications by linking the connector and sensor parts with wire length needed. Default setting is - 3mV/Cell/, °C compensated voltages are shown as below:

| Model | Upper limit of voltage compensation | Lower limit of voltage compensation | Compensation range of temperature |
|-------|-------------------------------------|-------------------------------------|-----------------------------------|
| 24V   | 30V                                 | 20V                                 | 0 ~ 40°C                          |
| 48V   | 60V                                 | 40V                                 |                                   |
| 380V  | 400V                                | 290V                                |                                   |

#### NOTE:

1. Different temperature compensation voltage can only be changed through the communication protocol.
2. The battery temperature compensation function only activates for 3 stage charging.

## 5.8 CMU2E, the GUI Controller For the NTN-5K

The CMU2E is a remote monitoring module designed to be used with the NTN-5K series. With its intuitive 7-inch TFT LCD touchscreen panel and physical buttons, users can easily perform on-site operations. The module's Ethernet port enables expanded connectivity, allowing for direct local-to-remote data access and real-time monitoring and control of the system. Equipped with four sets of programmable relays and five sets of isolated digital output signals, the CMU2E offers users flexibility in monitoring specific events or alarms. Additionally, the CMU2E supports data and event logging with date and time stamps, ensuring comprehensive record-keeping for analysis and troubleshooting. For detailed information, please refer to the CMU2E's User Manual.

Example of user interface:

## 5.9 Factory Resetting

Users can follow the steps below to restore factory settings for commands: 0x00B0~0x00B7, 0x00B9~0x00BB, 0x0100~0x0103 and 0x00C4.

1. Set the rotary switch of AD2 to position 0.
2. Turn on the Main S.W. with the remote off. There should be no AC output in this condition.
3. Rotate the rotary switch from position 0 to position 7 and then back to position 0 again within 15 seconds.
4. If all of the LED indicators flash green three times, it means that the reset procedure has been done successfully.
5. The unit will load the factory default parameters after recycling the Main S.W.

AD2

## 6. Communication Protocol

### 6.1 Modbus Communication Interface

The device supports Modbus RTU with the master-slave principle. Users are able to read and write parameters of the device through the protocol, including remote ON/OFF, AC voltage/frequency setting, etc. During data transfer, please follow the principle of first sending the Hi byte and then the Lo byte except Error Check (CRC16 checksum).

Physical Layer setting as below:

| Control      | Setting |
|--------------|---------|
| Baud Rate    | 115200  |
| Data Bits    | 8       |
| Stop Bit     | 1       |
| Parity       | None    |
| Flow Control | None    |

#### 6.1.1 Communication Timing

- Min. request period (Controller to PSU/CHG): 50mSec °
- Max. response time (PSU/CHG to Controller): 12.5mSec °
- Min. packet margin time (Controller to PSU/CHG): 12.5mSec °

### 6.1.2 Modbus Frame Encapsulation

Modbus RTU consists of Additional Address, Function Code, Data and Error Check.

| Additional Address | Function Code | Data    | Error Check |
|--------------------|---------------|---------|-------------|
| 1 byte             | 1 byte        | N bytes | 2 bytes     |

Additional address (1byte): Defines inverter's slave ID.

Function code (1byte): The function code is used to tell the slave what kind of action to perform.

Data (N bytes): For data exchange, contents and data length are dependent on different function codes.

Error Check (2bytes): Utilizes CRC-16.

### 6.1.3 Additional Address Definition

Additional address is the slave ID of the device. Each NTN-5K unit should have their unique and own device address to communicate over the Bus.

| Slave ID  | Description   |
|-----------|---|
| 0xC0 + XX | XX means device address (assigned by AD1 and AD2). For example: Address is set at 63, meaning Slave ID = 0xC0 + 0x3F = 0xFF |
| 0x00      | Broadcast   |

Note: XX means the address of the NTN-5K. Please refer to 4.7 Communication Address/ID Assignment for detailed.

### 6.1.4 Function Code Description

The main purpose of the function codes is to tell the slave what kind of action to perform. For example: Function code 03 will query the slave to read holding registers and respond with the master their contents.

| Function Code          |      | Description            |
|------------------------|------|------------------------|
| Read Holding Register  | 0x03 | Read Holding Register  |
| Read Input Register    | 0x04 | Read Input Register    |
| Preset Single Register | 0x06 | Preset Single Register |

### 6.1.5 Data Field and Command Lists

Data field provides additional information by the slave to complete the action specified by the function code (FC) in a request. The data field typically includes register addresses, count values, and written data. There are several forms according to the function codes.

FC = 03/04

| Starting Address | Quantity of (Input) Registers |
|------------------|-------------------------------|
| 2 Bytes          | 2 Bytes                       |

FC = 06

| Register Address | Register Value |
|------------------|----------------|
| 2 Bytes          | 2 Bytes        |

Command list:

| Command Code | Command Name       | Function code | # of data Bytes | Description   |
|--------------|--------------------|---------------|-----------------|---|
| 0x0050       | READ_VIN           | 0x04          | 2               | Single-phase input voltage (Bypass)<br>(format: value, F=0.1)       |
| 0x0053       | READ_IIN           | 0x04          | 2               | Single-phase input current (Bypass)<br>(format: value, F=0.1)       |
| 0x0056       | READ_FREQ          | 0x04          | 2               | Single-phase input frequency (Bypass)<br>(format: value, F=0.01)    |
| 0x0062       | READ_TEMPERATURE_1 | 0x04          | 2               | Internal temperature read value<br>(format: value, F=0.1)           |
| 0x0070       | READ_FAN_SPEED_1   | 0x04          | 2               | Fan 1 speed read value<br>(format: value, F=1)                      |
| 0x0071       | READ_FAN_SPEED_2   | 0x04          | 2               | Fan 2 speed read value<br>(format: value, F=1)                      |
| 0x0080       | MFR_ID_B0B5        | 0x03          | 6               | Manufacture's name  |
| 0x0083       | MFR_ID_B6B11       | 0x03          | 6               | Manufacture's name  |

| 0x012B       | READ_AC_IOUT    | 0x04          | 2               | AC output current read value<br>(format: value, F=0.1)            |

Modbus unlock command: C0 06 00 CF 4D 57 DD 8A

NOTE:

1. Before setting commands of Output ACV\_Set and Output ACF\_Set, please utilize the SETTING\_UBLOCK command to unlock. Refer to section 6.2.2 for detailed instructions.
2. Setting commands with \* at the end support the EEP\_OFF and EEP\_CONFIG functions. For detailed information on how to enable them, please refer to SYSTEM\_CONFIG (0x00C4).

**Data conversion:**

The conversion of setting and reading values is defined as following:

Actual value = Communication reading value × Factor (F value).

Among them, Factor needs to refer to the definition of SCALING\_FACTOR in each model list.

EX: AC output frequency read value = READ\_FREQ × Factor.

If the Factor of READ\_FREQ of a certain model is 0.01, the communication reading value is 0x1770 (hexadecimal) → 6000 (decimal), then VDC\_real = 6000 × 0.01 = 60Hz.

◎MFR\_ID\_B0B5(0x0080) is the first 6 codes of the manufacturer's name (ASCII); MFR\_ID\_B6B11(0x0083) is the last 6 codes of the manufacturer's name (ASCII)

EX: manufacturer's name is MEANWELL → MFR\_ID\_B0B5 is MEANWE ; MFR\_ID\_B6B11 is LL

| MFR_ID_B0B5 |        |        |        |        |        |
|-------------|--------|--------|--------|--------|--------|
| Byte 0      | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 |
| 0x4D        | 0x45   | 0x41   | 0x4E   | 0x57   | 0x45   |

| MFR_ID_B6B11 |        |        |        |        |        |
|--------------|--------|--------|--------|--------|--------|
| Byte 0       | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 |
| 0x4C         | 0x4C   | 0x20   | 0x20   | 0x20   | 0x20   |

◎MFR\_MODEL\_B0B5 (0x0086) is the first 6 codes of the manufacturer's model name ' (ASCII); MFR\_MODEL\_B6B11 (0x0089) is the last 6 codes of the manufacturer's model ' name (ASCII)

EX: Model name is NTN-5K-224 → MFR\_MODEL\_B0B5 is NTN-5K; MFR\_MODEL\_B6B11 is -224

| MFR_MODEL_B0B5 |        |        |        |        |        |
|----------------|--------|--------|--------|--------|--------|
| Byte 0         | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 |
| 0x4E           | 0x54   | 0x4E   | 0x2D   | 0x35   | 0x4B   |

| MFR_MODEL_B6B11 |        |        |        |         |         |
|-----------------|--------|--------|--------|---------|---------|
| Byte 6          | Byte 7 | Byte 8 | Byte 9 | Byte 10 | Byte 11 |
| 0x2D            | 0x32   | 0x32   | 0x34   | 0x20    | 0x20    |

◎MFR\_REVISION\_B0B5 (0x008C) is the firmware revision. A range of 0x00 hexadecimal (R00.0)~0xFE (R25.4) represents the firmware version of an MCU; 0xFF represents no MCU existed.

EX: The inverter has three MCUs, the firmware version of the MCU number 1 is version R01.3 (0x0D), the MCU number 2 is version R01.2 (0x0C) and the MCU number 3 is version R01.1 (0x0B).

| Byte 0 | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 |
|--------|--------|--------|--------|--------|--------|
| 0x0D   | 0x0C   | 0x0B   | 0xFF   | 0xFF   | 0xFF   |

◎MFR\_DATE\_B0B5 (0x0091) is manufacture date (ASCII)

EX: MFR\_DATE\_B0B5 is 180101, meaning 2018/01/01

| Byte 0 | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 |
|--------|--------|--------|--------|--------|--------|
| 0x31   | 0x38   | 0x30   | 0x31   | 0x30   | 0x31   |

◎MFR\_SERIAL\_B0B5 (0x0094) and MFR\_SERIAL\_B6B11 (0x0097) are defined as manufacture date and manufacture serial number (ASCII)

EX: The first unit manufactured on 2018/01/01 → MFR\_SERIAL\_B0B5: 180101 ; MFR\_SERIAL\_B6B11: 000001

| MFR_SERIAL_B0B5 |        |        |        |        |        |
|-----------------|--------|--------|--------|--------|--------|
| Byte 0          | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 |
| 0x31            | 0x38   | 0x30   | 0x31   | 0x30   | 0x31   |

| MFR_SERIAL_B6B11 |        |        |        |         |         |
|------------------|--------|--------|--------|---------|---------|
| Byte 6           | Byte 7 | Byte 8 | Byte 9 | Byte 10 | Byte 11 |
| 0x30             | 0x30   | 0x30   | 0x30   | 0x30    | 0x31    |

©CURVE\_CONFIG(0x00B4) :

|           | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2  | Bit1  | Bit0  |

### 6.1.6 Modbus Communication Examples

The following provides examples of request and response for each function code of the Modbus RTU.

#### 6.1.6.1 Function Code

##### 6.1.6.1.1 Read Holding Registers (FC = 03)

The request message specifies the starting register and quantity of registers to be read. For example: the master requests the content of analog output holding registers 0x008C-0 008E (MFR\_REVISION\_B0B5) from slave 0

Request:

|      |      |        |        |        |
|------|------|--------|--------|--------|
| 0xC0 | 0x03 | 0x008C | 0x0003 | 0xD4F1 |
|------|------|--------|--------|--------|

0xC0: Slave ID 0

0x03: Function code 3 (Read Analog Output Holding R Registers)

0x008C: The Data Address of the first register requested.

0x0003: The total number of registers requested (Read 3 registers from 0x008C to 0x008E)

0xD4F1: CRC16 Error Check. Please be aware that CRC sending the Lo byte first.

Response:

|      |      |      |                |        |
|------|------|------|----------------|--------|
| 0xC0 | 0x03 | 0x06 | 0x0A0A0AFFFFFF | 0xD613 |
|------|------|------|----------------|--------|

0xC0: Slave ID 0

0x03: Function code 3 (Read Analog Output Holding R Registers)

0x06: The number of data bytes to follow (6 bytes).

0x0A0A0AFFFFFF, meaning that the firmware version of the MCU number 1~number 3 is R01.0

0xAD38: CRC16 Error Check. Please be aware that CRC sending the Lo byte first.

##### 6.1.6.1.2 Read Input Register (FC=04)

The request message specifies the starting register and quantity of registers to be read. For example: The master requests the content of analog input register 0x0056 (READ\_FREQ) from slave 0.

Request:

|      |      |        |        |        |
|------|------|--------|--------|--------|
| 0xC0 | 0x04 | 0x0056 | 0x0001 | 0xC10B |
|------|------|--------|--------|--------|

0xC0: Slave ID 0

0x04: Function code 4 (Read Analog Input Register)

0x0056: The Data Address of the first register requested

0x0001: The total number of registers requested (read only 1 registers from 0x0056)

0xC10B: CRC16 Error Check. Please be aware that CRC sending the Lo byte first.

Response:

|      |      |    |        |        |
|------|------|----|--------|--------|
| 0xC0 | 0x04 | 02 | 0x1770 | 0x8AF5 |
|------|------|----|--------|--------|

0xC0: Slave ID 0

0x04: Function code 4 (Read Analog Input Register)

0x02: The number of data bytes to follow (2 bytes)

0x1770: The contents of register: 0x0056 (READ\_FREQ). 0x 1770 = 6000 = 60.00Hz

0x8AF5: CRC16 Error Check. Please be aware that CRC sending the Lo byte first

##### 6.1.6.1.3 Write Single Register (FC=06)

The request message specifies the register reference to be written.

For example: The master writes 40V to analog output holding register of 0x00B9 (BAT\_ALM\_VOLT) for slave 0

Request:

|      |      |        |        |        |
|------|------|--------|--------|--------|
| 0xC0 | 0x06 | 0x00B9 | 0x0FA0 | 0x4D76 |
|------|------|--------|--------|--------|

0xC0: Slave ID 0

0x06: Function code 6 (Preset Single Register)

0x00B9: The Data Address of the register

0x0FA0: The value to write. 0x0FA0 → 4000 = 40V

0x4D76: CRC16 Error Check. Please be aware that CRC sending the Lo byte first

Response:

The normal response is an echo of the query, returned after the register contents have been written.

##### 6.1.6.2 Settings of Output ACV\_Set (0x0102) and Output ACF\_Set (0x0103)

To secure settings of the AC output voltage and frequency, a different writing method is required for Output ACV\_Set(0x0102) and Output ACF\_Set(0x0103) commands, that is these commands must first be unlocked by SETTING\_UBLOCK(0x00CF) before any changes can be made.

- Output ACV\_Set(0x0102)

|                         |  |
|-------------------------|--|
| C0 06 00 CF 4D 57 DD 8A | Unlock password is 0x4D57(MW)                  |
| C0 06 01 02 00 00 39 27 | AC output voltage setting is controlled by SW1 |

NOTE: After completing the settings, please reboot the inverter to apply the new changes

### 6.1.6.3 Remote-on/off via Communication

If ON/OFF control of the AC output via communication is required, first set Bit 1 (OP\_EN) of INV\_OPERATION(0x0100) to "1". Then, Bit 0 (OP\_CTRL) can be utilized to manage the state of the inverter's AC output. Below is an example of how to utilize the protocol to turn off the AC output.

### 6.1.6.4 Practical Operation

The following steps will describe how to configure the NTN-5K-148 or 248 to Energy-saving Mode and adjust its charge curve for 2-stage charging, with a constant current (CC) of 50A and a constant voltage (CV) of 56V.

⊙Set the address of the inverter to "0".

⊙Connect the D+/D- pins of the master to the corresponding D+(PIN2) and D-(PIN3) pins of the COMM connector on the inverter. It is recommended to establish a common ground for the communication system to increase its communication reliability by using GND-AUX (PIN1) of COMM.

⊙Recommended settings are as follows

| Control      | Setting |
|--------------|---------|
| Baud Rate    | 115200  |
| Data Bits    | 8       |
| Stop Bit     | 1       |
| Parity       | None    |
| Flow Control | None    |

- ⊙Adding a 120 termination resistor to both the controller and inverter end can increase communication stability
- ⊙If the unit is a terminal, it is recommended to connect a termination resistor, that is short circuit PIN1 and PIN3 of CRL.

⊙Configure communication settings after power on. First, set the NTN-5K to 2-stage charging.

- 0xC0: Slave ID0
- 0x06: Function code 6 (Write Single Register)
- 0x00B4: CURVE\_CONFIG register
- 0x0040: Set to 2 stage charging. Please refer to definition of CURVE\_CONFIG for detailed information
- 0x1C1A: CRC16 Error Check

⊙Set c constant current to 50A

- 0xC0: Slave ID0
  - 0x06: Function code 6 (Write Single Register)
  - 0x00B0: CURVE\_CC register
  - 0x1388: 50A → 5000 → 0x1388
  - 0x95AA: CRC16 Error Check
- NOTE: Conversion factor for CURVE\_CC is  $0.01 \cdot \text{so} \frac{50A}{F=0.01} = 5000$

©Set constant voltage to 56V

|      |      |        |        |        |
|------|------|--------|--------|--------|
| 0xC0 | 0x06 | 0x00B1 | 0x15E0 | 0xC624 |
|------|------|--------|--------|--------|

0xC0: Slave ID0

0x06: Function code 6 (Write Single Register)

0x00B1: CURVE\_CV register

0x15E0: 56V → 5600 → 0x15E0

0xC624: CRC16 Error Check

NOTE: Conversion factor for CURVE\_CV is  $0.01 \cdot \text{so } \frac{56V}{F=0.01} = 5600$

©Set operation mode to Energy-saving Mode

|      |      |        |        |        |
|------|------|--------|--------|--------|
| 0xC0 | 0x06 | 0x0101 | 0x0001 | 0x08E7 |
|------|------|--------|--------|--------|

0xC0: Slave ID0

0x06: Function code 6 (Write Single Register)

0x0101: INV\_CONFIG register

0x0001: Set to Energy-saving Mode. Please refer to definition of CURVE\_CONFIG for detailed information

0x5DDE: CRC16 Error Check

©Finally, check whether RC\_1(PIN3) and +5-AUX 2(PIN1) pins of the RAP1 or PAR 2 connector are short-circuited if there is no AC output voltage

## 6.2 CAN Bus Communication Interface

- Physical layer specification  
This protocol follows CAN ISO-11898 with Baud rate of 250Kbps.

- Data Frame  
This protocol uses Extended CAN 29-bit identifier frame format or CAN 2.0B.

- Communication Timing  
 Min. request period (Controller to NTN-5K): 50mSec ◦  
 Max. response time (NTN-5K to Controller): 12.5mSec ◦  
 Min. packet margin time (Controller to NTN-5K): 12.5mSec ◦

- Data Field Format  
Controller to NTN  
Write:

Data filed bytes

|                |                 |               |                |
|----------------|-----------------|---------------|----------------|
| 0              | 1               | 2             | 3              |
| COMD. low byte | COMD. high byte | Data low byte | Data high byte |

Data filed bytes

|                |                 |
|----------------|-----------------|
| 0              | 1               |
| COMD. low byte | COMD. high byte |

NTN to Controller

Response:

Data filed bytes

|                |                 |            |       |             |
|----------------|-----------------|------------|-------|-------------|
| 0              | 1               | 2          | ...   | 7           |
| COMD. low byte | COMD. high byte | Data low 1 | ..... | Data high 6 |

Note: NTN-5K will not send data back when write parameters, such as Output ACV\_Set

### 6.2.1 Message ID Definition

| Message ID | Description                                |
|------------|--|
| 0x000C04XX | NTN-5K to Controller Message ID            |
| 0x000C05XX | Controller to NTN-5K Message ID            |
| 0x000C05FF | Controller broadcasts to NTN-5K Message ID |

Note: XX means the address of the NTN-5K. Please refer to 4.7 Communication Address/ID Assignment for detailed.

### 6.2.2 CAN Bus Command List

| Command Code | Command Name       | Transaction Type | # of data Bytes | Description   |
|--------------|--------------------|------------------|-----------------|---|
| 0x0050       | READ_VIN           | R                | 2               | Single-phase input voltage (Bypass) (format: value, F=0.1)    |
| 0x0053       | READ_IIN           | R                | 2               | Single-phase input current (Bypass) (format: value, F=0.1)    |
| 0x0056       | READ_FREQ          | R                | 2               | Single-phase input frequency (Bypass) (format: value, F=0.01) |
| 0x0062       | READ_TEMPERATURE_1 | R                | 2               | Internal temperature read value (format: value, F=0.1)        |
| 0x0070       | READ_FAN_SPEED_1   | R                | 2               | Fan 1 speed read value (format: value, F=1)                   |
| 0x0071       | READ_FAN_SPEED_2   | R                | 2               | Fan 2 speed read value (format: value, F=1)                   |
| 0x0080       | MFR_ID_B0B5        | R                | 6               | Manufacture's name  |
| 0x0081       | MFR_ID_B6B11       | R                | 6               | Manufacture's name  |
| 0x0082       | MFR_MODEL_B0B5     | R                | 6               | Manufacture model name  |
| 0x0083       | MFR_MODEL_B6B11    | R                | 6               | Manufacture model name  |
| 0x0084       | MFR_REVISION_B0B5  | R                | 6               | Firmware version  |
| 0x0085       | MFR_LOCATION_B0B2  | R/W              | 3               | Manufacture location  |
| 0x0086       | MFR_DATE_B0B5      | R/W              | 6               | Manufacture date  |

| Command Code | Command Name     | Transaction Type | # of data Bytes | Description  |
|--------------|------------------|------------------|-----------------|--|
| 0x0087       | MFR_SERIAL_B0B5  | R/W              | 6               | Manufacture serial number  |
| 0x0088       | MFR_SERIAL_B6B11 | R/W              | 6               | Manufacture serial number  |
| 0x00B0       | CURVE_CC*        | R/W              | 2               | Constant current setting of charge curve (format: value, F=0.01) |
| 0x00B1       | CURVE_CV*        | R/W              | 2               | Constant voltage setting of charge curve (format: value, F=0.01) |
| 0x00B2       | CURVE_FV*        | R/W              | 2               | Float voltage setting of charge curve (format: value, F=0.01)    |

| MFR_ID_B6B11 |        |        |        |        |        |
|--------------|--------|--------|--------|--------|--------|
| Byte 0       | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 |
| 0x4C         | 0x4C   | 0x20   | 0x20   | 0x20   | 0x20   |

◎MFR\_MODEL\_B0B5(0x0082) is the first 6 codes of the manufacturer's model name(ASCII); MFR\_MODEL\_B6B11(0x0083) is the last 6 codes of the manufacturer's model name (ASCII)

EX: Model name is NTN-5K-224 → MFR\_MODEL\_B0B5 is NTN-5K; MFR\_MODEL\_B6B11 is -224

| MFR_MODEL_B0B5 |        |        |        |        |        |
|----------------|--------|--------|--------|--------|--------|
| Byte 0         | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 |
| 0x4E           | 0x54   | 0x4E   | 0x2D   | 0x35   | 0x4B   |

| MFR_MODEL_B6B11 |        |        |        |         |         |
|-----------------|--------|--------|--------|---------|---------|
| Byte 6          | Byte 7 | Byte 8 | Byte 9 | Byte 10 | Byte 11 |
| 0x2D            | 0x32   | 0x32   | 0x34   | 0x20    | 0x20    |

◎MFR\_REVISION\_B0B5 (0x0084) is the firmware revision. A range of hexadecimal 0x00(R00.0)~0xFE (R25.4) represents the firmware version of an MCU; 0xFF represents no MCU existed.

EX: The inverter has three MCUs, the firmware version of the MCU number 1 is version R01.3 (0x0D), the MCU number 2 is version R01.2 (0x0C) and the MCU number 3 is version R01.1 (0x0B).

| Byte 0 | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 |
|--------|--------|--------|--------|--------|--------|
| 0x0D   | 0x0C   | 0x0B   | 0xFF   | 0xFF   | 0xFF   |

◎MFR\_DATE\_B0B5 (0x0086) is manufacture date (ASCII)

EX: MFR\_DATE\_B0B5 is 180101, meaning 2018/01/01

| Byte 0 | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 |
|--------|--------|--------|--------|--------|--------|
| 0x31   | 0x38   | 0x30   | 0x31   | 0x30   | 0x31   |

◎MFR\_SERIAL\_B0B5 (0x0087) and MFR\_SERIAL\_B6B11 (0x0088) are defined as manufacture date and manufacture serial number (ASCII)

EX: The first unit manufactured on 2018/01/01 → MFR\_SERIAL\_B0B5: 180101 ; MFR\_SERIAL\_B6B11: 000001

| MFR_SERIAL_B0B5 |        |        |        |        |        |
|-----------------|--------|--------|--------|--------|--------|
| Byte 0          | Byte 1 | Byte 2 | Byte 3 | Byte 4 | Byte 5 |
| 0x31            | 0x38   | 0x30   | 0x31   | 0x30   | 0x31   |

| MFR_SERIAL_B6B11 |        |        |        |         |         |
|------------------|--------|--------|--------|---------|---------|
| Byte 6           | Byte 7 | Byte 8 | Byte 9 | Byte 10 | Byte 11 |
| 0x30             | 0x30   | 0x30   | 0x30   | 0x30    | 0x31    |

©CURVE\_CONFIG(0x00B4) :

|           | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2  | Bit1  | Bit0  |

| Low byte  | -    | STGS | -    | -    | TCS  |       | CUVS  |       |

Low byte :

Bit 0:1 CUVS: Charge Curve Selection

00 = Customized charge Curve (default)

01 = Gel Battery

10 = Flooded Battery

11 = AGM Battery

Bit 2:3 TCS: Temperature Compensation Setting

00 = disable

01 = -3 mV/°C/cell (default)

10 = -4 mV/°C/cell

11 = -5 mV/°C/cell

Bit 6:STGS: 2/3 Stage Charge Setting

0 = 3 stage charge (default, CURVE\_CV and CURVE\_FV)

1 = 2 stage charge (only CURVE\_CV)

High byte:

Bit 0 CCTOE: Constant Current Stage Timeout Indication Enable

0 = disable (default)

1 = enabled

Bit 1 CVTOE: Constant Voltage Stage Timeout Indication Enable

0 = disable (default)

1 = enabled

Bit 2 FVTOE: Float Voltage Stage Timeout Indication Enable

0 = disable (default)

1 = enabled

Note: Unsupported settings displays with "0"

Low byte:

Bit 0:INV: Inverter mode

0 = The AC output is NOT provided from the inverter

1 = The AC output is provided from the inverter

Bit 1:BYP: Bypass mode

0 = The AC output is NOT provided from the external AC source (Utility)

1 = The AC output is provided from the external AC source (Utility)

Bit 2:UTI\_OK: Utility power exist

0 = Utility power failure

1 = Utility power normal

Bit 3:CHG\_ON: Charger status

0 = Charger OFF

1 = Charger ON

Bit 4:SOLAR\_ON: Solar charger control ON

0 = Enable signal for the external solar charger

1 = Disable signal for the external solar charger

Bit 5:SAVING: Saving Mode  
 0 = The inverter is NOT in Saving Mode  
 1 = The inverter is in Saving Mode

Bit 6: Bat\_Low\_ALM: Battery low alarm  
 0 = Battery low alarm is NOT triggered  
 1 = Battery low alarm is triggered

High byte:

Bit 0:1 INV\_PHASE: Inverter output phase setting  
 b00 = 0°(Default)  
 b10 = 120° (For Three-phase 4-wire configuration only)  
 b11 = -120° (For Three-phase 4-wire configuration only)

Unsupported settings displays with "0"

⊙INV\_FAULT(0x011E) :

|           | Bit7     | Bit6     | Bit5     | Bit4      | Bit3    | Bit2    | Bit1     | Bit0    |

Low byte:

Bit 0:OLP\_100 : OLP 100 ~ 115 %  
 0 = No  
 1 = Yes

Bit 1:OLP\_115 : OLP 115 ~ 150 %  
 0 = No  
 1 = Yes

Bit 2:OLP\_150 : OLP 150% ~  
 0 = No  
 1 = Yes

Bit 3:OTP : OTP  
 0 = No  
 1 = Yes

Bit 4: INV\_UVP: Inverter UVP  
 0 = No  
 1 = Yes

Bit 5: INV\_OVP: Inverter OVP  
 0 = No  
 1 = Yes

Bit 6: SCP: Short circuit protection  
 0 = No  
 1 = Yes

Bit 7: EEP\_Err: EEPROM error code  
 0 = No  
 1 = Yes

High byte:

Bit 0: SHDN: System Shutdown  
 0 = No  
 1 = Yes

Bit 1: FAN\_FAIL: Fan lock  
 0 = No  
 1 = Yes

Bit 2: Bat\_UVP: Battery under-voltage shutdown  
 0 = No  
 1 = Yes

Bit 3: Bat\_OVP: Battery over-voltage shutdown  
 0 = No  
 1 = Yes

Bit 4: INV\_Fault: Inverter Fault  
 0 = No  
 1 = Yes

### 6.2.3 CAN Bus Communication Examples

The following provides examples of command sending and data reading for the CAN Bus protocol.

#### 6.2.3.1 Sending Command

The master adjusts CURVE\_CV of the unit with address "0" to 50V.

| CAN ID     | DLC(data length) | Command code | Data   |
|------------|------------------|--------------|--------|
| 0x000C0500 | 0x4              | 0xB100       | 0x8813 |

Command code: 0x00B1 (CURVE\_CV) → 0xB1(Lo) + 0x00(Hi)

Data: 50V → 5000 → 0x1388 → 0x88(Lo) + 0x13(Hi)

NOTE: Conversion factor for CURVE\_CC is  $0.01 \cdot$  so  $\frac{50V}{0.01} = 5000$

#### 6.2.3.2 Reading Data or Status

The master reads operation mode (INV\_CONFIG or 0x0101) from the unit with address "01".

| CAN ID     | DLC(data length) | Command code |
|------------|------------------|--------------|
| 0x000C0501 | 0x2              | 0x0101       |

The unit with address "01" returns data below:

| CAN ID     | DLC(data length) | Command code | Data   |
|------------|------------------|--------------|--------|
| 0x000C0401 | 0x4              | 0x0101       | 0x0000 |

Data: 0x0000, meaning that the unit with address "01" is operating in UPS mode.

#### 6.2.3.3 Settings of Output ACV\_Set (0x0102) and Output ACF\_Set (0x0103)

To secure settings of the AC output voltage and frequency, a different writing method is required for Output ACV\_Set(0x0102) and Output ACF\_Set(0x0103) commands, that is these commands must first be unlocked by SETTING\_UBLOCK(0x00CF) before any changes can be made.

Unlock password

- SETTING\_UBLOCK(0x00CF)

| CAN ID     | DLC(data length) | Command code | Data   |
|------------|------------------|--------------|--------|
| 0x000C0500 | 0x4              | 0xCF00       | 0x574D |

Set AC output voltage

- Output ACV\_Set(0x0102)

| CAN ID     | DLC(data length) | Command code | Data   |
|------------|------------------|--------------|--------|
| 0x000C0500 | 0x4              | 0x0201       | 0x0100 |

NOTE: After completing the settings, please reboot the inverter to apply the new changes

#### 6.2.3.4 Remote-on/off via Communication

If ON/OFF control of the AC output via communication is required, first set Bit 1 (OP\_EN) of INV\_OPERATION(0x0100) to "1". Then, Bit 0 (OP\_CTRL) can be utilized to manage the state of the inverter's AC output. Below is an example of how to utilize the protocol to turn off the AC output.

| CAN ID     | DLC(data length) | Command code | Data   |
|------------|------------------|--------------|--------|
| 0x000C05XX | 0x04             | 0x0001       | 0x0200 |

#### 6.2.4 Practical Operation

The following steps will describe how to configure the NTN-5K-148 or 248 to Energy-saving Mode and adjust its charge curve for 2-stage charging, with a constant current (CC) of 50A and a constant voltage (CV) of 56V.

- Ⓞ Set the address of the inverter to "0".

- Ⓞ Connect the CANH/CANL pins of the master to the corresponding CANH(PIN2)/CANL(PIN3) pins of the COMM connector on the inverter. It is recommended to establish a common ground for the communication system to increase its communication reliability by using GND-AUX (PIN1) of COMM.
- Ⓞ Set baud rate: 250kbps, type: extended
- Ⓞ Adding a 120Ω termination resistor to both the controller and inverter's end can increase communication stability
- Ⓞ If the unit is a terminal, it is recommended to connect a termination resistor, that is short circuit PIN1 and PIN 3 of CRL.

©Configure communication settings after power on. First, set the NTN-5K to 2-stage charging.

| CAN ID     | DLC(data length) | Command code | Data   |
|------------|------------------|--------------|--------|
| 0x000C0500 | 0x04             | 0xB400       | 0x4000 |

Command cod: 0x00B4 (CURVE\_CONFIG)

Data: 0x40(Lo) + 0x00 (Hi) • Please refer to definition of CURVE\_CONFIG for detailed information

©Set constant current to 50A

| CAN ID     | DLC(data length) | Command code | Data   |
|------------|------------------|--------------|--------|
| 0x000C0500 | 0x4              | 0xB000       | 0x8813 |

Command cod: 0x00B0 (CURVE\_CC)

Data: 50A → 5000 → 0x1388 → 0x88(Lo) + 0x13(Hi)

NOTE: Conversion factor for CURVE\_CC is 0.01 • so  $\frac{50A}{F0.01} = 5000$

©Set constant voltage to 56V

| CAN ID     | DLC(data length) | Command code | Data   |
|------------|------------------|--------------|--------|
| 0x000C0500 | 0x4              | 0xB100       | 0xE015 |

Command cod: 0x00B1 (CURVE\_CV)

Data: 56V → 5600 → 0x15E0 → 0xE0(Lo) + 0x15(Hi)

NOTE: Conversion factor for CURVE\_CC is 0.01 • so  $\frac{56V}{F0.01} = 5600$

©Set operation mode to Energy-saving Mode

| CAN ID     | DLC(data length) | Command code | Data   |
|------------|------------------|--------------|--------|
| 0x000C0500 | 0x4              | 0x0101       | 0x0100 |

Command cod: 0x0101 (INV\_CONFIG)

Data: 0x01(Lo) + 0x00(Hi) • Please refer to definition of INV\_CONFIG for detailed information

©Finally, check whether RC\_1(PIN3) and +5-AUX 2(PIN1) pins of the RAP1 or PAR 2 connector are short-circuited if there is no AC output voltage

## 6.3 Value Range and Tolerance

(1)Display parameters

| Command                    | Model              | Display value range | Tolerance           |
|----------------------------|--------------------|---------------------|---------------------|

| 0x00BA                     | BAT_SHDN_VOLT  | 124/224 | 18.4V~24V           | ±0.24V    | 19V     |
|                            |                | 148/248 | 36.8V~48V           | ±0.48V    | 38V     |
|                            |                | 2380    | 270V~320V           | ±3.8V     | 280V    |
| 0x00BB                     | BAT_RCHG_VOLT  | 124/224 | 18.4V~CURVE_FV      | ±0.24V    | 18.4V   |
|                            |                | 148/248 | 36.8V~CURVE_FV      | ±0.48V    | 36.8V   |
|                            |                | 2380    | 270V~CURVE_FV       | ±3.8V     | 270V    |
| MOD: 0x00C4<br>CAN: 0x00C2 | SYSTEM_CONFIG  | ALL     | N/A                 | N/A       | 0000h   |
| 0x0100                     | INV_OPERATION  | ALL     | N/A                 | N/A       | 0005h   |
| 0x0101                     | INV_CONFIG     | ALL     | N/A                 | N/A       | 0000h   |
| 0x0102                     | Output ACV_Set | ALL     | N/A                 | N/A       | 0000h   |
| 0x0103                     | Output ACF_Set | ALL     | N/A                 | N/A       | 0000h   |

Note:

i.READ\_CHG\_CURR will display ZERO amp when output current is less than values in the table below.

| Model | Minimum readable | Model | Minimum readable |
|-------|------------------|-------|------------------|
| 124   | 2.03A±2.4A       | 248   | 1.05A±1.4A       |
| 224   | 2.03A±2.7A       | 2380  | 0.17A±0.23A      |
| 148   | 1.05A±1.2A       |       |                  |

ii.If the AC output is set to OFF by the INV\_OPERATION (0x0100) command via the communication protocol, it will revert to ON when the inverter is recycled.

iii.Due to the limited write cycles of the EEPROM, it is advisable to consider using the SYSTEM\_CONFIG (0x00C4) command to select an appropriate EEPROM writing logic, especially if parameter settings are frequently altered.

iv.Writing parameters to Output ACV\_Set (0x0102) and Output ACF\_Set (00103) commands require a reboot to take effect.

v.The battery voltage settings must satisfy the following condition: CURVE\_CV ≥ CURVE\_FV > BAT\_ALM\_VOLT ≥ BAT\_SHDN\_VOLT + 0.2V; otherwise, the new changes will not take effect.

## 7. Protections and Troubleshooting

### 7.1 Protections

#### AC Output Protection:

- AC Output Overload Protection:  
When the inverter is overloaded, it can still supply AC power for a short period of time. If the loads do not return to the normal range, the OLP will be triggered, automatically turning off the inverter. Once the overload condition is resolved, it is necessary to re-power on the inverter to resume operation.

#### AC Output Short Circuit Protection :

- When a short circuit occurs or the load increases significantly, the inverter will turn off for protection. Once the faulty condition is resolved, it is necessary to re-power on the inverter to resume operation.

#### DC Input Protection:

- DC Polarity Protection:  
When the DC polarity is connected reversely, the inverter will not be damaged but with no function. Once the faulty condition is resolved, re-power on the inverter to resume normal operation.
- Low DC Input Protection :  
When the DC input falls below the operating range, the inverter will automatically turn off for protection. After the fault condition is removed, inverter will restart automatically.
- Over Voltage of DC Input :  
When the voltage of DC input over the operating range, the inverter will turn off for protection. After the fault condition is removed, inverter will restart automatically. If the inverter cannot operate normally afterwards, it represents that the inverter is damaged. Please return the unit to MEAN WELL's distributor for further service.

#### Inverter Protection:

##### Over Temperature Protection (OTP):

When the temperature inside the inverter reaches a certain level, the inverter will automatically turn off for protection. After the temperature drops back to the operating range, the inverter will restart automatically.

### 7.2 Troubleshooting

Once a failure condition occurs, the LEDs on the AC panel will display a specific code to indicate its faulty condition. The fault conditions can be classified into 4 categories: AC output protection, DC input protection, over-temperature protection, or others. Please refer to the following table for troubleshooting. If the fault condition cannot be resolved, please contact MEAN WELL's distributor for further assistance.

| fault signal                     | Possible cause                           | Suggestions for Fault correction  |
|----------------------------------|--|---|
| Status ●<br>DC Input ○<br>Load ☀ | Over load protection                     | Check if the load requires high startup current, such as inductive or capacitance loads. After the fault condition is removed, re-power the inverter for operation.   |
|                                  | Short circuit protection                 | Check if the load requirement exceeds the rated value or if the circuit is shorted.   |
| Status ●<br>DC Input ☀<br>Load ○ | Aged battery or malfunction              | Replace with a new battery  |
|                                  | Wrong battery capacitance                | Re-check if the parameter of battery suits inverter's operating parameter   |
| Status ●<br>DC Input ☀<br>Load ☀ | Over temperature protection              | Remove subject away from venthole if any. If it's due to high ambient, please lower the temperature or load to proceed. After the temperature drops back to the operating range, the inverter will restart automatically. |
| Status ☀<br>DC Input ○<br>Load ○ | Other fault condition that's not defined | Contact MEAN WELL's distributor   |

Note: ● Light  
 ☀ Flash  
 ○ Light off

## 8. Warranty

This product provides 5 years warranty under normal usage. Do not replace parts or any form of modification to the product in order to keep the warranty effectively.
