Communication Note

UHP-1500-HV communication instruction

A.PMBus communication interface

◎ UHP-1500 is compliant with PMBus Rev.1.1, the maximum communication speed is 100KHz and the maximum number of assignable addresses is up to 8 units on a bus.

◎PMBus communication interface is able to provide the current operating status and information as follows:

1.Output voltage, current and internal temperature.

2.Alarm and status

3.Manufacturer's and model data.

1.Set the PMBus address

◎ When communicating with PMBus, each UHP-1500 must be configured with a unique and non-duplicate device address.

The 7-bits addressing mode of the UHP-1500 is defined below.

MSB						LSB
1	0	0	0	A2	A1	A0

It can be set by the 3-pole DIP switch.When the switch is placed in the upper ON position, it is a logical "0", and when placed in the lower OFF position, it is a logical "1".DIP switch can specify eight different addresses.

Table 1-1 shows the switch positions and corresponding addresses.

Module No.	Device address		
	A0	A1	A2
	DIP switch position		
	1	2	3
0	ON	ON	ON
1	OFF	ON	ON
2	ON	OFF	ON
3	OFF	OFF	ON
4	ON	ON	OFF
5	OFF	ON	OFF
6	ON	OFF	OFF
7	OFF	OFF	OFF

Table 1-1

2.PMBus control setting mode

◎ The default source of power mode control is PV/PC or SVR control, while PMBus control needs to be started using PM_CTRL in Command BEh.When the PMBus control is enabled, the machine can be set by OPERATION(01h), VOUT_TRIM(22h), IOUT_OC_FAULT_LIMIT(46h) and other commands.The OPERATION, VOUT_ TRIM, and IOUT_ OC_ FAULT_ LIMIT commands are configurable but not valid.For details about the command control mode and value, see 4. Command List.

NOTE: The OPERATION, VOUT_TRIM, IOUT_OC_FAULT_LIMIT Settings will be stored in EEPROM and will be reloaded at the next startup.

3.Command 01h Operational Behavior Setting

◎ Initial behavior of the power supply can be changed by setting OPERATION_INIT of SYSTEM_CONFIG(BEh), for example: power on without output.

For detailed information, please refer to 4. Command List.

4.PMBus Command List

◎ The command list of the UPH-1500 is shown in Table 4-1. It is compliant with the standard protocol of PMBus Rev 1.1. For more detailed information, please refer to PMBus official website (http://pmbus.org/specs.html)。

2.When using PMBus to adjust output voltage, VOUT_COMMAND only can be used to display the rated voltage of the unit and cannot be written. It is VOUT_ TRIM that provides voltage trimming function. Take UHP-1500-115 as an examples, to get a 67V output, please set value of VOUT_TRIM to -48V. Adjustable voltage range for each model is shown as below

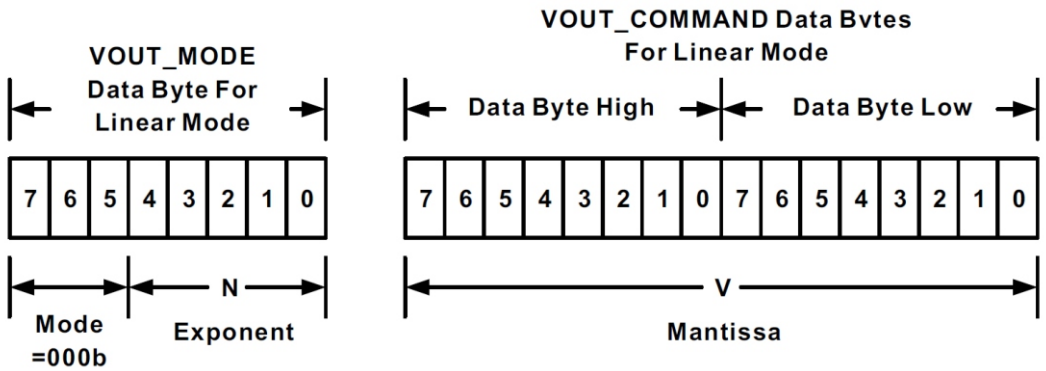
Model	Adjustable voltage range
115V	57.5 ~ 138V
230V	108 ~ 260V
380V	167 ~ 400V

Table 5-4

3. Insert a at least 35msec delay between commands.

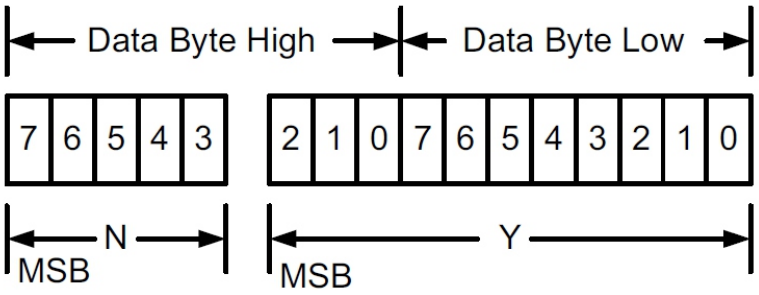
4. Set and read numeric conversion instructions

(1) LINEAR16 format：VOUT_COMMAND、VOUT_TRIM、READ_VOUT.Actual voltage = Communication reading V × 2^N
The value of N is defined in the VOUT_MODE command.



Linear Format Data Bytes
The Mode bits are set to 000b.
The Voltage, in volts, is calculated from the equation:
Voltage=$VX2^N$
Where:
Voltage is the parameter of interest in volts;
V is a 16 bit unsigned binary integer; and
N is a 5 bit two's complement binary integer.
EX: Vo_real(actual output voltage)= $VX2^N$.IF VOUT_MODE=0x17, meaning N is-7。
READ_VOUT is 0xBE00→ 48640 , then Vo_real = 48640 $X2^{-7}$ = 380V。

(2) LINEAR11 format：IOUT_OC_FAULT_LIMIT、READ_VIN、READ_IIN、READ_IOUT、READ_TEMPERATURE_1、READ_FAN_SPEED_1、READ_FAN_SPEED_2。



Linear Data Format Data Bytes Y, N and the "real world" value is:
The relation between
$X = YX2^N$
Where, as described above:
X is the "real world" value;
Y is an 11 bit, two's complement integer; and
N is a 5 bit, two's complement integer.
Devices that use the Linear format must accept and be able to process any value of N
EX: Io_real(actual output current)= $Y \times 2^N$ .IF READ_IOUT is 0xCA40h，
meaning N is -7 and Y is 0x0240→ 576, then Io_real = $576 \times 2^{-7} = 4.5A$

6. Practical Operation

The following steps will describe how to set the UHP-1500-380 to 330V.

1. Set the address of the charger to “0”， Refer to Table 1-1

2. Connect the SDA, SCL and GND pins of the master to the corresponding SDA (PIN7) and SCL(PIN8) of CN77 and GND-AUX (PIN3&PIN4) of CN77 on the supply.

◎ Set speed: 100KHz

3. Communication function can be accessed immediately after UHP-1500-380 is connected to AC. Set output voltage at 330V.

Address(7 bit)	Operation	Command Code	Data
0x40	Write	0x22	0x00, 0x 9C

Command code: 0x22(VOUT_TRIM)
Data: 330V → 0x00(Lo) + 0x9C(Hi)

4.It is recommended to review all of the settings and parameters using the appropriate commands. In the event that they do not meet your requirements, you may rewrite them as needed. EX: Read VOUT_TRIM to check whether output voltage was set to a proper level.

Address(7 bit)	Operation	Command Code	Data
0x40	Write	0x22	0x00, 0x 9C

READ VOUT_TRIM

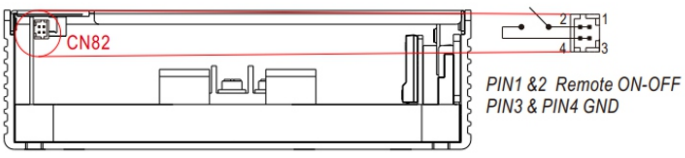
Address(7 bit)	Operation	Command Code
0X40	Read	0X22

The unit returns data below

Address(7 bit)	Data
0X40	0x00,0x9C

Data: 0x00(Lo) + 0x9C(Hi) → 0x9C00 → -25600 × 2^{-9}= -50V。
380V-50V = 330V，the result is correct

5. Finally, if the power supply has no output, please confirm that the Remote ON-OFF pin of the CN82 is shorted with PIN3&PIN4 (GND). Also please make sure command sending/reading is in an interval of below 4 sec in order not to trigger



Remote ON-OFF	Power Supply Status
Short circuit	ON
Open circuit	OFF

6. Communication example

6.1 Sending comman

The master adjusts output voltage of the unit with address "01" to 330V.

CAN ID	DLC (data length)	Command code	Parameters
0xC0101	0x4	0x2000	E880

Command code: 0x0020 (VOUT_SET) → 0x20(Lo) + 0x00(Hi)

Parameters: 330V →33000 → 0x80E8→ 0xE8(Lo) + 0x80(Hi)

NOTE: VOUT_SET conversion factor is 0.01, so $\frac{330V}{F=0.01} = 33000$

6.2 Reading data or status

The master reads operation setting from the unit with address "00".

CAN ID	DLC (data length)	Command code
0xC0100	0x2	0x0000

The unit with address "00" returns data below

CAN ID	DLC (data length)	Command code	Parameters
0xC0000	0x3	0x0000	0x01

Parameters: 0x01 ON, which stands for operation on the "00" unit.

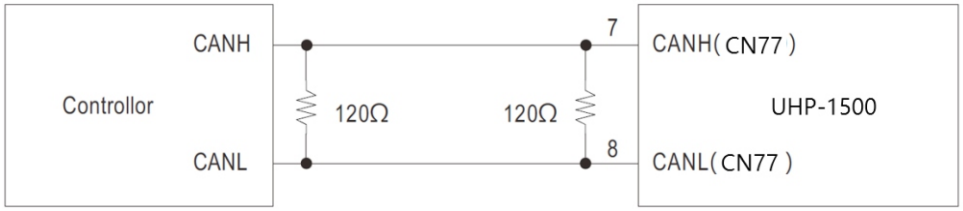
6.3. Practical Operation

The following steps will describe how to set the UHP-1500-380 to 330V。

1. Set the address of the charger to “0”， Refer to Table 2-1.

2. Connect the CANH/CANL pins of the master to the correspondingCANH(PIN7) and CANL(PIN8)pins of the CN77 connector on the supply. It is recommended to establish a common ground for the communication system to increases its communication reliability by using GND-AUX(PIN3&4) of CN77

◎ Set baud rate: 250kbps, type: extended.
◎ Adding a 120Ω terminal resistor to both the controller and rack shelf ends can increase communication stability.



3.Communication function can be accessed immediately after UHP-1500-380 is connected to AC. Set output voltage at 330V.

CAN ID	DLC(data length)	Command Code	Paramenters
0XC0100	0X04	0X2000	E880

Command code: 0x0020(VOUT_SET)
Data: 330V → 33000 → 0x80E8 → 0xE8(Lo) + 0x80(Hi)

NOTE: VOUT_SET conversion factor is 0.01, so $\frac{330V}{F=0.01} = 33000$

4.It is recommended to review all of the settings and parameters using the appropriate commands. In the event that they do not meet your requirements, you may rewrite them as needed.

EX: Read VOUT_SET to check whether output voltage was set to a proper level.

Read VOUT_SET

CAN ID	DLC(data length)	Command Code
0XC0100	0X04	0X2000

The unit returns data below

CAN ID	DLC (data length)	Command code	Parameters
0xC0000	0x04	0x2000	E880
